**NOTE: EOL for non-green parts to occur on 5/13/10 per PDN U-09-01**

### DESCRIPTION:

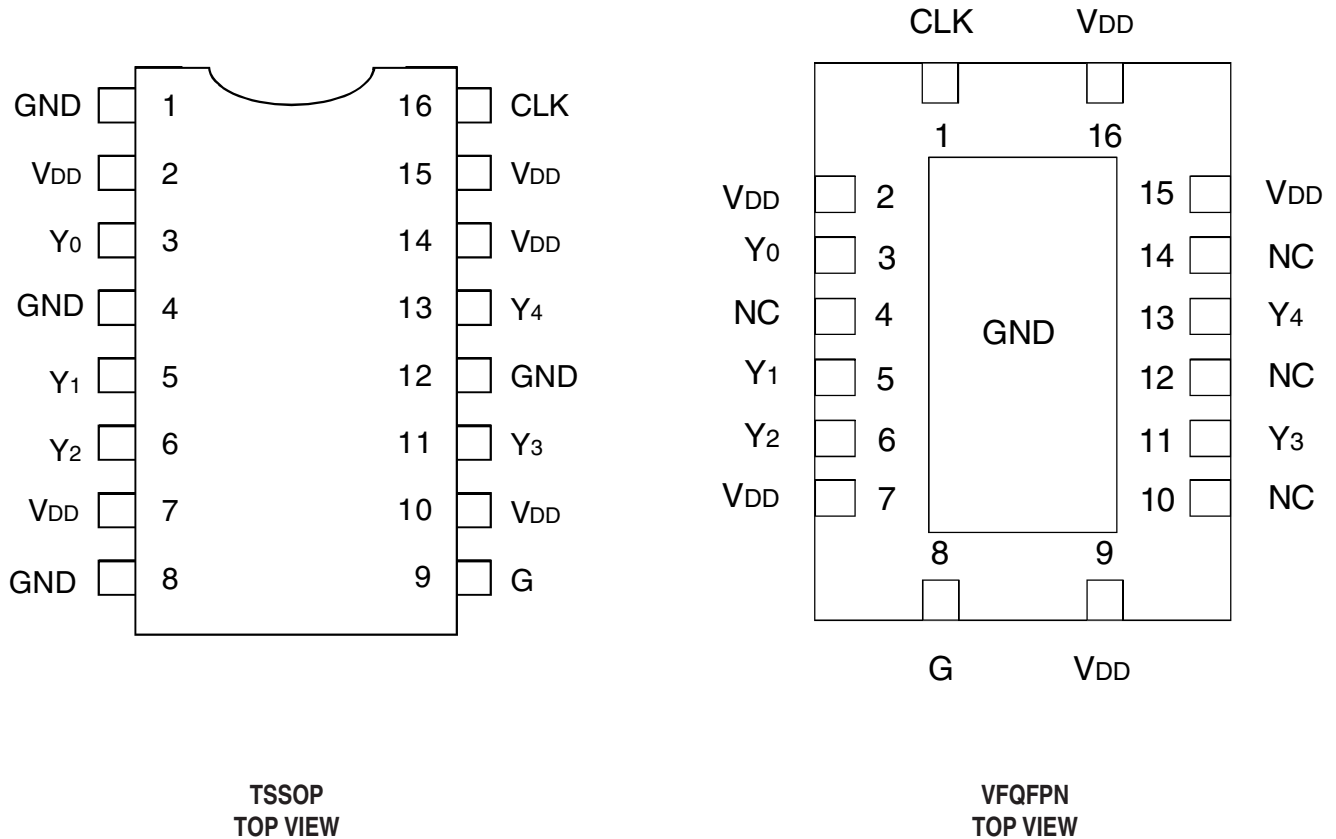

The IDT5V2305 is a high performance, low skew clock buffer that operates up to 200MHz. One bank of five outputs provides low skew copies of CLK. Through the use of control pin G, the outputs of bank Y(0:4) can be placed in a low state regardless of CLK input. The device operates in 2.5V and 3.3V environments. The built-in output enable glitch suppression ensures a synchronized output enable sequence to distribute full period clock signals.

The IDT5V2305 is characterized for operation from  $-40^{\circ}C$  to  $+85^{\circ}C$ .

## OUTPUT ENABLE GLITCH SUPPRESSION CIRCUIT

The purpose of the glitch suppression circuitry is to ensure the output enable sequence is synchronized with the clock input such that the output buffer will be enabled on the next full period of the input clock (negative edge triggered by the input clock). The G input must be stable one  $t_{EN}$  - time prior to the falling edge of the CLK for predictable operation.
