## APPLICATIONS:

- Ideally suited for stacked DIMM DDR registered applications
- Along with CSPT857C/D, Zero Delay PLL Clock buffer, provides complete solution for DDR1 DIMMs

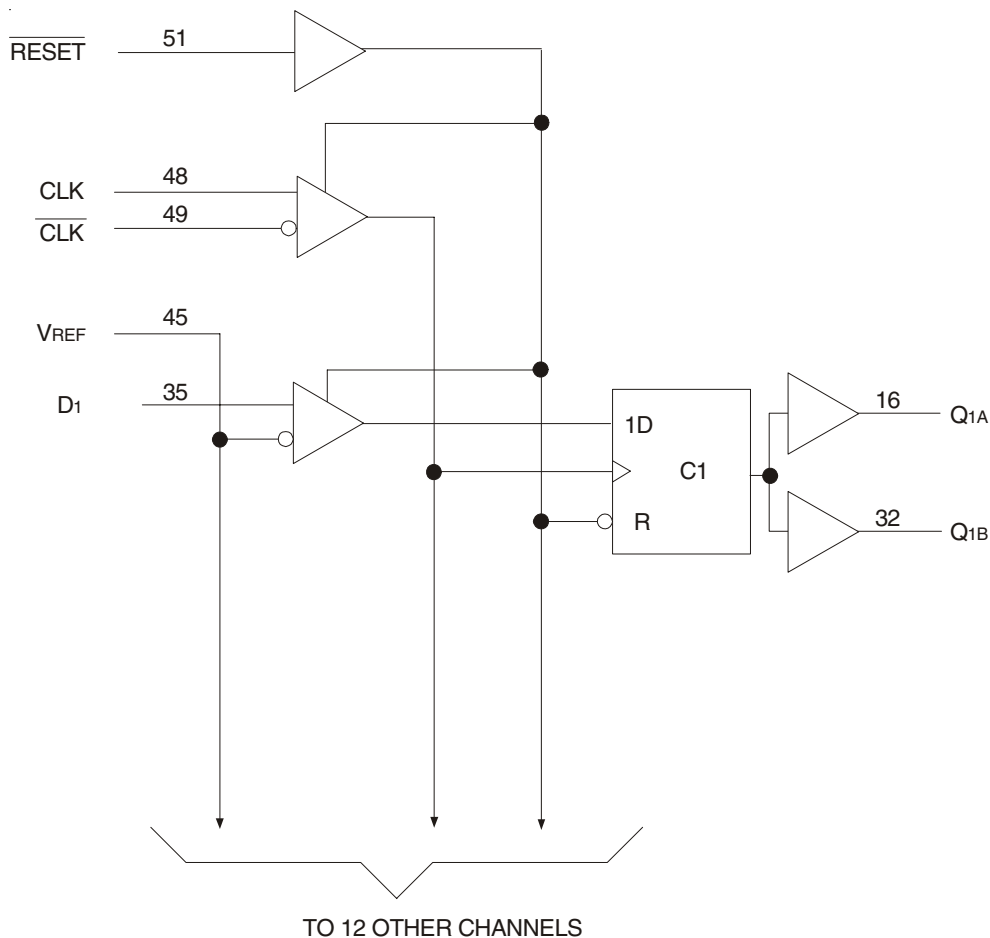

## DESCRIPTION:

The SSTVN16859C is a 13-bit to 26-bit registered buffer designed for 2.3V-2.7V  $V_{DD}$  for PC1600 - PC2700 and 2.5V-2.7V  $V_{DD}$  for PC3200, and supports low standby operation. All data inputs and outputs are SSTL\_2 level compatible with JEDEC standard for SSTL\_2.

$\overline{\text{RESET}}$  is an LVCMOS input since it must operate predictably during the power-up phase.  $\overline{\text{RESET}}$ , which can be operated independent of CLK and  $\overline{\text{CLK}}$ , must be held in the low state during power-up in order to ensure predictable outputs (low state) before a stable clock has been applied.

$\overline{\text{RESET}}$ , when in the low state, will disable all input receivers, reset all registers, and force all outputs to a low state, before a stable clock has been applied. With inputs held low and a stable clock applied, outputs will remain low during the Low-to-High transition of  $\overline{\text{RESET}}$ .
