

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Evaluation Kit for iJB Series Surface Mount Power Modules with PMBus™

Features

- iJB12060A007V-001-R power module
- USB to PMBus Dongle Board
- Cables to make PC connection
- Required Input & Output filter capacitors
- CD with TDK Smart Power Module Interface GUI

Ordering Information

Code	Input Voltage	Output Voltage	Output Current	Note
iJB_Evaluation_Kit-R	8.0-14.0V	0.6 – 2V	60A	Refer to product data sheet for module performance details
iJB_Eval_Kit_Parallel-R	8.0-14.0V	0.6 – 2V	110A	Comes with two iJB modules installed to allow parallel module evaluation

-R indicates RoHS-6 compliance

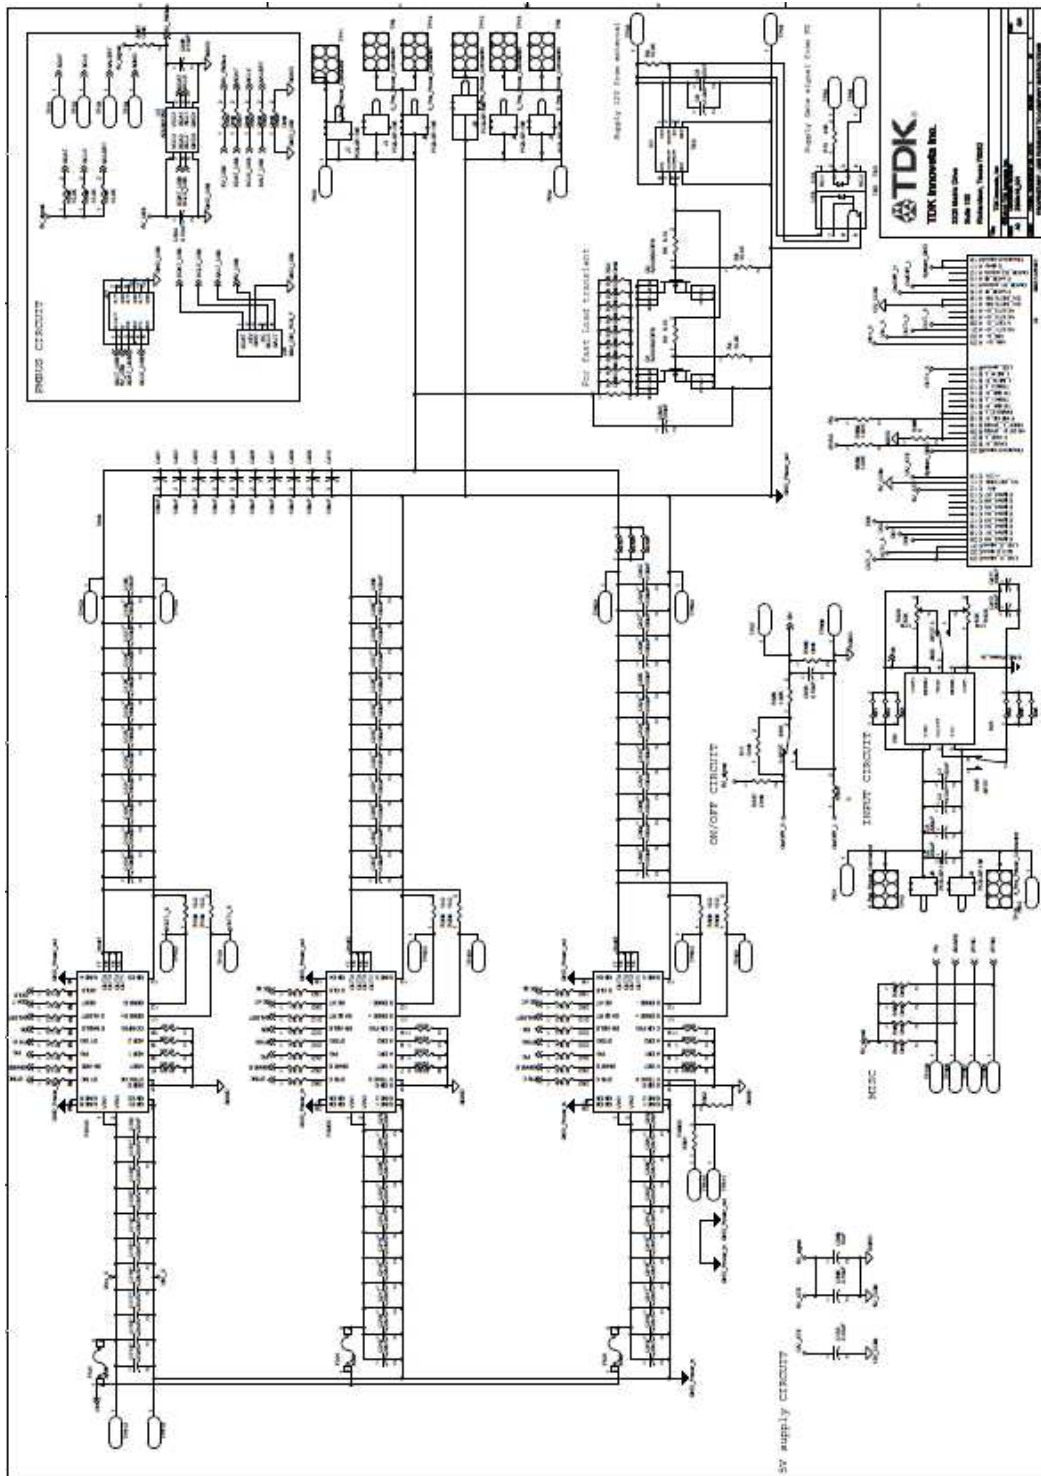

iJB Evaluation Board Installation

- **System requirements**
 - Windows XP, Windows 7 (32bit or 64bit)
 - Java
 - Free USB port
- **GUI installation**
 - Do not connect USB cable !
 - Install “SmartPower_1.1_20130926_win32-setup.exe”
 - Follow the instruction by the installer
 - Close GUI
- **Evaluation board set-up**
 - Apply 12V source to the Vin terminal (see picture 1)
 - Connect USB cable to board and PC
 - Driver will be installed

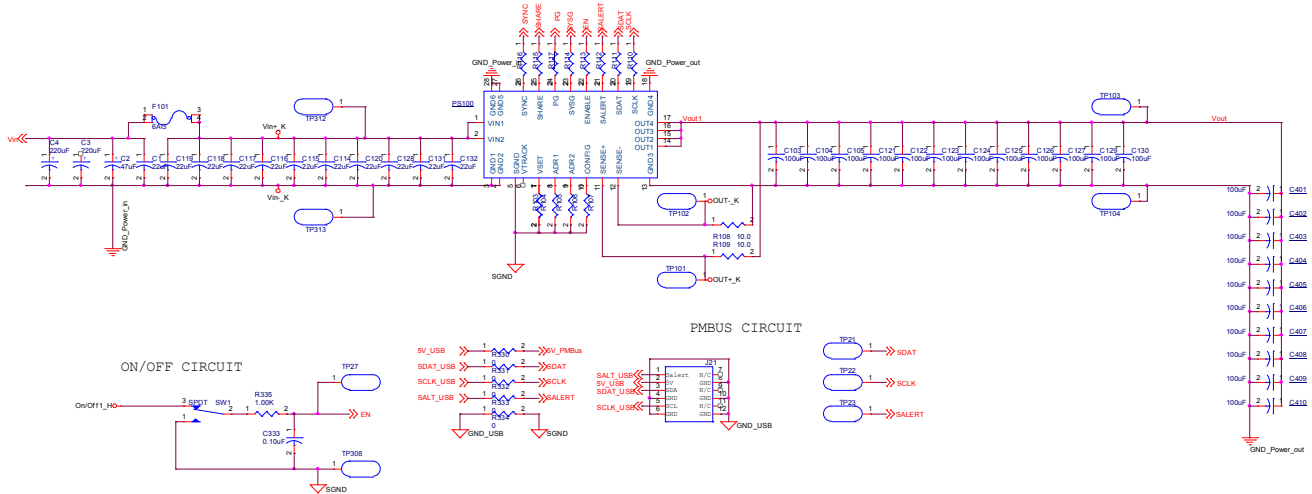

PICTURE 1

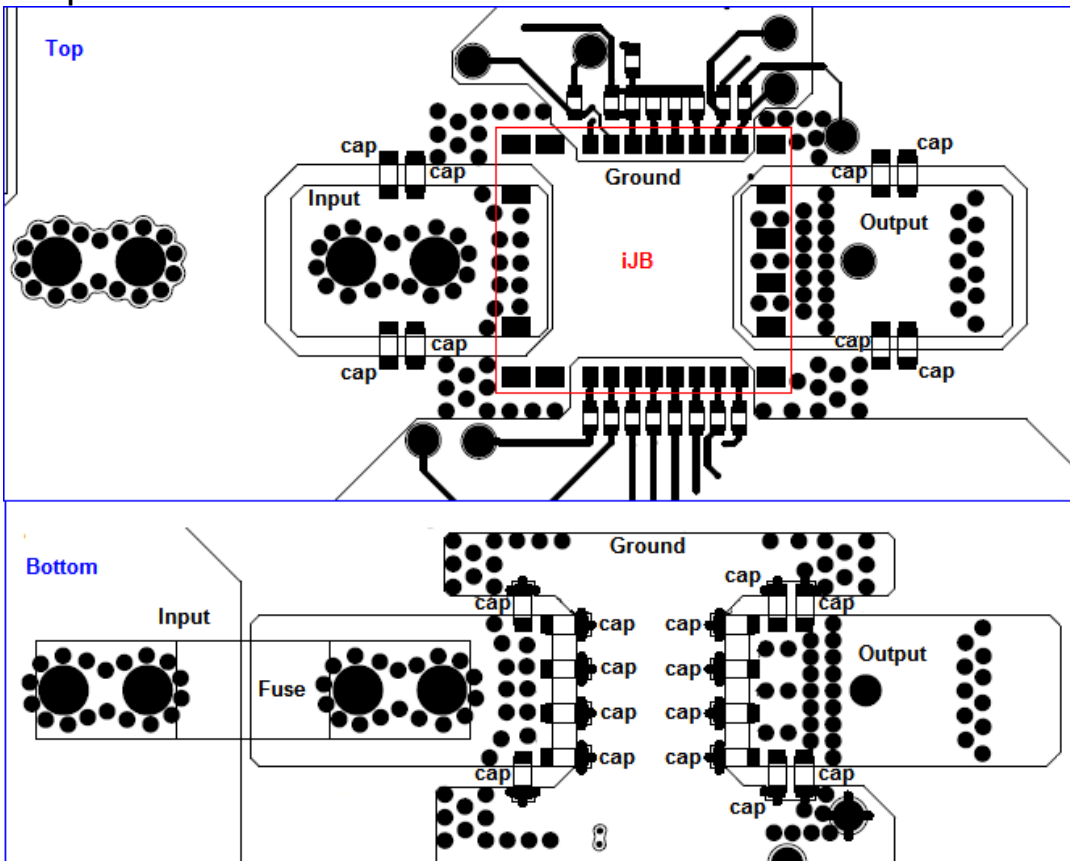

COMPLETE SCHEMATIC (not all parts are populated in standard EV Kit)

SIMPLIFIED SCHEMATIC:

SIMPLIFIED LAYOUT – showing vias & placement of suggested ceramic filter capacitors near power module

REF DESIGNATOR	VALUE, SIZE, RATING	PART NUMBER	SUPPLIER
COOUTPUT – 12 pieces	100uF, 1206, 6.3V	C3216X5R0J107MT	TDK
Note 10 additional output capacitors of same type (C401-C410) are populated further away from power module			
CINPUT – 10 pieces	22uF, 1206, 16V	C3216X5R1C226MT	TDK

Convenient Test Point Terminal Locations:

- **Switch SW1**
 - **Position**
 - “Open” iJB module in ON mode
 - “Closed” iJB module in OFF mode
- **Test Points (see picture 2)**
 - TP 106: connected to PGOOD pin of each iJB
 - TP 308: Signal Ground
 - TP 27: via 10Ω connected to ENABLE pin of each iJB

Convenient Test Point Terminal Locations:

- **Test Points (see picture 4)**
 - TP 24: i²C Bus Signal Ground
 - TP 23: i²C Bus Signal Alert
 - TP 21: i²C Bus Signal Data
 - TP 22: i²C Bus Signal Clock

 - TP 103: + sense of iJB module
 - TP 104: - sense of iJB module
- **Picture 3 shows pin location of iJB Module**

USB Dongle board is attached by connector and can be easily removed and connected to real application board to assist with communication and debugging work.

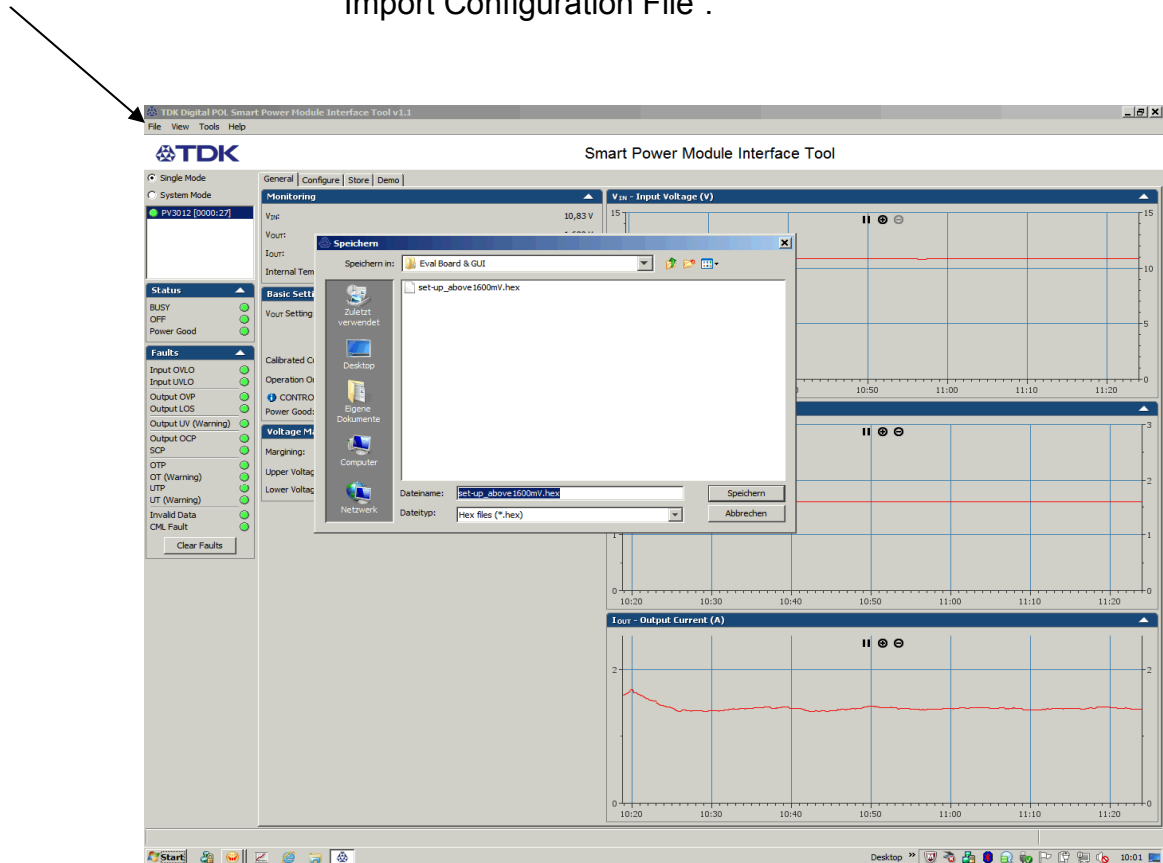

GUI Operation:

The evaluation kit is designed to automatically detect and display the connected power module. Please refer to the power module data sheet for deeper understanding of supported commands and expected operation of the power module. The power module comes pre-configured with default settings. The GUI will allow users to easily change many settings and explore performance options.

Note: The store function can be used only 2-3 times before memory is filled up and the device can not be reprogrammed any more. To ensure highest reliability, we did not use flash memory in this part. User can change settings as often as desired in working memory to try things, but generally should not store to the NVM (non-volatile memory). Settings can be exported to a file to use again later rather than storing to the device's NVM.

Store: Store your settings in the "FILE " menu "Export Configuration File".

Load: You can load your settings any time during operation by using the "FILE " menu "Import Configuration File".

Once the device is powered on and detected by PC on the USB port it will appear on the device list. Immediately below the device list is the status & faults window for the detected device.

System mode is for parallel evaluation only

I²C device name [I²C address]

green except during NVM storage operation

shows if the module is ON or OFF

indicates if V_{out} is within the limits

green when V_{in} is lower than set limit in the fault section

green when V_{in} is higher than set limit in the fault section

green when V_{out} is lower than set limit in the fault section

loss of sense, when V_{sense} is lost module will be set OFF

green when V_{out} is higher than set limit in the fault section

green when I_{out} is lower than set limit in the fault section

green when short circuit protection has not been active

green when Temp. is lower than set limit in the fault section

green when Temp. is lower than set limit in the fault section

green when Temp. is higher than set limit in the fault section

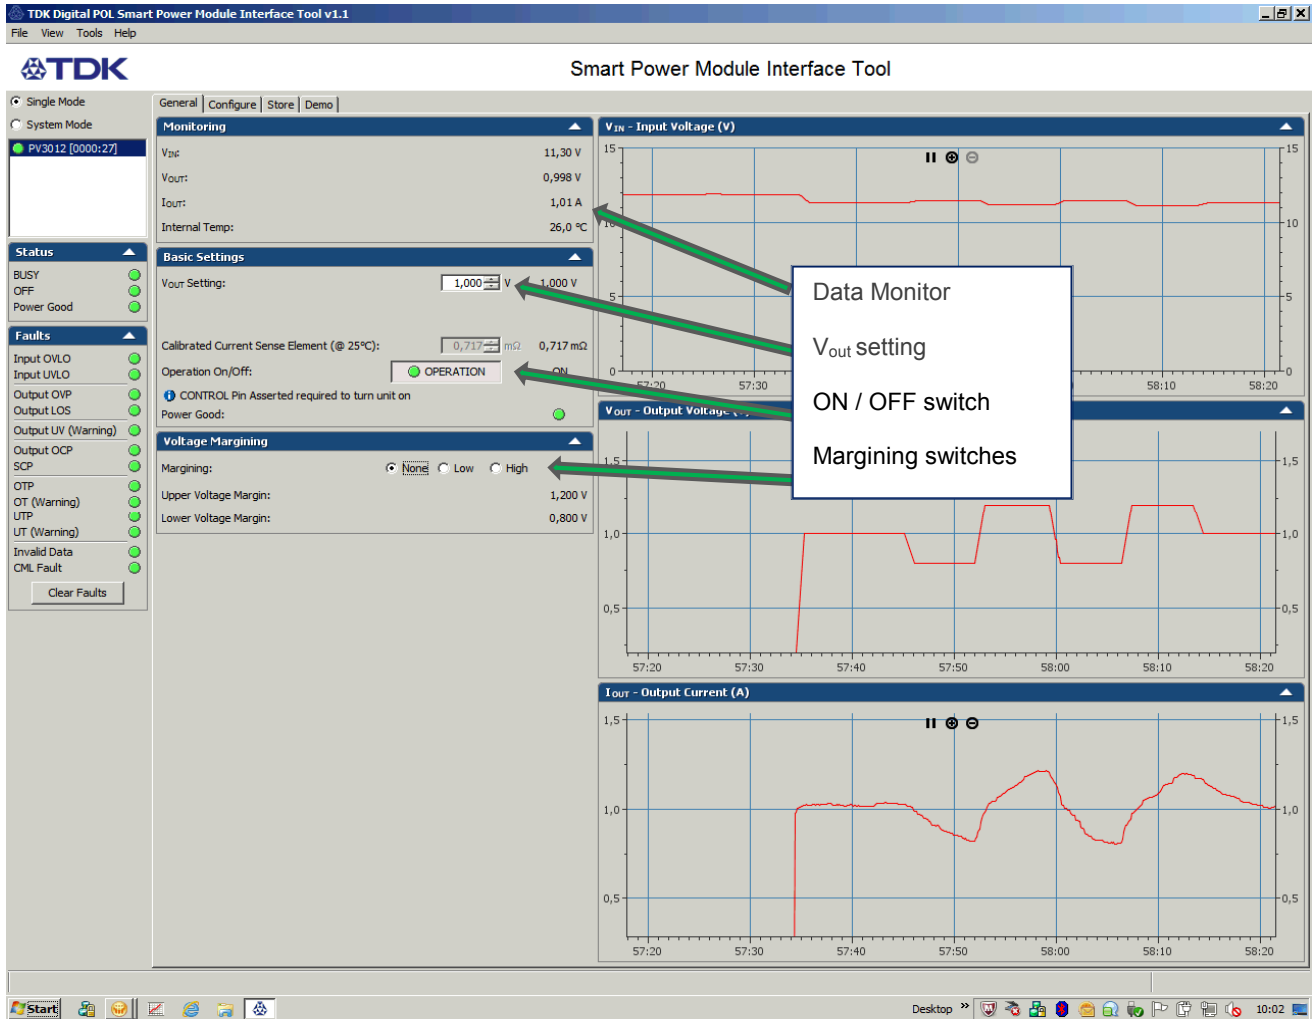

green when Temp. is higher than set limit in the fault section

indicates invalid or unsupported data

indicates communication / memory / logic status

Clear Faults can be used to clear any previous fault flags that were raised

GUI main screen – the output voltage set point can be changed, the margin up & down are automatically updated to keep a correct percentage. The monitoring graphs can be paused, zoomed in, zoomed out using the button bars in the top center of the charts.

GUI configure tab screen - the configure tab and sub tabs allow the device to be configured in more detail. The basic tab allows the user to change items such as turn on delay and rise time, on/off polarity, and voltage margining range. Users should pay special attention to the Vout Scale Loop button which may need to be changed to exercise the module over the full operating voltage range. This adjustment is generally automatically done by the module in a real / non-EV kit application.

Basic Tab

Configuration

Vout Trim:	<input type="text" value="0,000"/>	V	0,000 V	
Vout Max:	<input type="text" value="1,600"/>	V	1,600 V	
Vout Scale Loop:	Internal Rdiv On/Off	<input type="text" value="1,0000"/>	1,0000	
Vout Tracking:	<input checked="" type="radio"/> Off	<input type="radio"/> 50%	<input type="radio"/> 100%	OFF
Slew Rate:	<input type="text" value="3,125"/>	mV/μs	3,125 mV/μs	
ON Rise Time:	<input type="text" value="9,9"/>	ms	9,9 ms	
ON Time Delay:	<input type="text" value="0,0"/>	ms	0,0 ms	
OFF Time Delay:	<input type="text" value="500,0"/>	ms	500,0 ms	
Upper Voltage Margin:	<input type="text" value="20,0"/>	%	1,200 V	
Lower Voltage Margin:	<input type="text" value="-20,0"/>	%	0,800 V	

On/Off Configuration

Requires OPERATION ON:	<input checked="" type="radio"/> Yes	<input type="radio"/> No	YES
Requires CTRL Pin Asserted:	<input checked="" type="radio"/> Yes	<input type="radio"/> No	YES
CTRL Pin Polarity:	<input type="radio"/> Active High	<input checked="" type="radio"/> Active Low	LOW
CTRL Pin Off Action:	<input type="radio"/> Immediate OFF	<input checked="" type="radio"/> Turn Off Delay	DELAY

Power Stage

Calibrated Current Sense Element (@ 25°C):	<input type="text" value="0,717"/>	mΩ	0,717 mΩ
--	------------------------------------	----	----------

Text Boxes:

- Top Right:** In addition, the power modules feature an internal voltage divider which can be disabled to enhance voltage setpoint accuracy when no attenuation is required (output voltage 1.5V or lower). During startup the module will turn the divider on or off depending on the VOUT_OV_FAULT_LIMIT that was determined based on Rset value. With voltage attenuation off VOUT_MAX = 1.6V. With voltage attenuation on VOUT_MAX=3.5V.
- Middle Right:** If you want to change to higher voltage then you must turn voltage divider on (select 0.2857). This will happen automatically if resistor on Vset pin is changed so generally a user does not need to worry about this item, but in case of EV-kit they may need to turn on or off.
- Bottom Center:** Select "YES" to activate and use the "Operation" button located at bottom of the GENERAL page.

The fault tab allows the user to change items such as over current thresholds, input and output over voltage thresholds and response times. There are some software limits and safe guards to help prevent damage to the EV-kit, but users should still exercise care to keep settings within the power module's ratings to avoid inadvertent damage to the kit.

Basic Fault

Fault Limits

Input OVLO Limit:	14,00 V	14,00 V
Input UVLO Turn-On Threshold:	7,60 V	7,60 V
Input UVLO Turn-Off Threshold:	7,00 V	7,00 V
Output OVP Limit:	1,600 V	1,600 V
Output OVP Response Delay:	40,00 μs	40,00 μs
Output OVP Retry/Latch:	Retry	Retry
Output OCP Limit:	10 A	10 A
Output OCP Response Delay:	1500,0 μs	1500,0 μs
Output OCP Retry/Latch:	Retry	Retry
Output OCP Retry Delay:	500 ms	500 ms
OTP Limit:	50 °C	50 °C
UTP Limit:	-50 °C	-50 °C

Warning Limits

Output UV Limit:	0,721 V	0,721 V
OT Limit:	50 °C	50 °C
UT Limit:	-30 °C	-30 °C

Fault: except for UTP when a fault limit is exceeded a fault signal is indicated, and the module will be shut down.

Warning: when a warning limit is exceeded a warning signal is indicated, the module will continue operation.

Start Desktop 10:03

The store tab allows the user to permanently change the configuration in NVM so values will be retained during next power up. As explained on page 7, this feature generally should not be performed on the EV-kit.

Do NOT use "STORE" function.

The screenshot shows the 'Smart Power Module Interface Tool' window. The 'Store' button is highlighted with a red arrow pointing to a warning box that says 'Do NOT use "STORE" function.' The interface includes a 'Default Settings' dialog box with various configuration options such as 'Storage Spact Usage', 'Customer info', 'Your ~ Margins', 'Digital Stress Share', 'Fault Limits', 'Warning Limits', and 'Programmable Power Good'. A vertical label 'Factory Settings' is positioned on the right side of the configuration area.
