

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

The Altera® Low Latency 40- and 100-Gbps Ethernet (40GbE and 100GbE) media access controller (MAC) and PHY MegaCore® functions offer the lowest round-trip latency and smallest size to implement the *IEEE 802.3ba 40G and 100G Ethernet Standard* with an option to support the *IEEE 802.3ap-2007 Backplane Ethernet Standard*.

**Note:** This user guide documents the 16.0 version of the Altera Low Latency 40- and 100-Gbps Ethernet MAC and PHY IP core that targets a Stratix® V device or an Arria® 10 device. For the 16.1 release and beyond, two IP core user guides are available to document the Low Latency 40-Gbps Ethernet IP core and the Low Latency 100-Gbps Ethernet IP core separately. These two user guides document the variations that target an Arria 10 device. As of 2017.12.28, the 16.0 version of the Stratix V Low Latency 40-100GbE IP core is the most recent Stratix V Low Latency 40-100GbE IP core available in the Self-Service Licensing Center and this user guide provides its most current documentation.

The version of this product that supports Arria 10 devices is included in the Altera MegaCore IP Library and available from the Quartus® Prime IP Catalog.

**Note:** The full product name, Low Latency 40- and 100-Gbps Ethernet MAC and PHY MegaCore Function, is shortened to Low Latency (LL) 40-100GbE IP core in this document. In addition, although multiple variations are available from the parameter editor, this document refers to this product as a single IP core, because all variations are configurable from the same parameter editor.

**Figure 1-1: Low Latency 40GbE and 100GbE MAC and PHY IP Cores**

Main blocks, internal connections, and external block requirements.

As illustrated, on the MAC client side you can choose a wide, standard Avalon® Streaming (Avalon-ST) interface, or a narrower, custom streaming interface. Depending on the variant you choose, the MAC client side Avalon Streaming (Avalon-ST) interface is either 256 or 512 bits of data mapped to either four or ten 10.3125 Gbps transceiver PHY links, depending on data rate, or to four 25.78125 Gbps transceiver PHY links.

The 40GbE (XLAUI) interface has 4x10.3125 Gbps links. The 100GbE (CAUI) interface has 10x10.3125 Gbps links. For Arria 10 devices only, you can configure a 40GbE 40GBASE-KR4 variation to support Backplane Ethernet. For Arria 10 GT devices only, you can configure a 100GbE CAUI-4 option, with 4x25.78125 Gbps links.

The FPGA serial transceivers are compliant with the IEEE 802.3ba standard XLAUI, CAUI, and CAUI-4 specifications. The IP core configures the transceivers to implement the relevant specification for your IP core variation. You can connect the transceiver interfaces directly to an external physical medium dependent (PMD) optical module or to another device.

The IP core provides standard MAC and physical coding sublayer (PCS) functions with a variety of configuration and status registers. You can exclude the statistics registers. If you exclude these registers, you can monitor the statistics counter increment vectors that the IP core provides at the client side interface and maintain your own counters.

## Low Latency 40- and 100-Gbps Ethernet MAC and PHY IP Core Supported Features

All LL 40-100GbE IP core variations include both a MAC and a PHY, and all variations are in full-duplex mode. These IP core variations offer the following features:

- Designed to the *IEEE 802.3ba-2010 High Speed Ethernet Standard* available on the IEEE website ([www.ieee.org](http://www.ieee.org)).
- Soft PCS logic that interfaces seamlessly to Altera 10.3125 Gbps and 25.78125 Gbps serial transceivers.
- Standard XLAUI or CAUI external interface consisting of FPGA hard serial transceiver lanes operating at 10.3125 Gbps, or the CAUI-4 external interface consisting of four FPGA hard serial transceiver lanes operating at 25.78125 Gbps.
- Supports 40GBASE-KR4 PHY based on 64B/66B encoding with data striping and alignment markers to align data from multiple lanes.
- Supports 40GBASE-KR4 PHY and forward error correction (FEC) option for interfacing to backplanes.
- Supports Synchronous Ethernet (Sync-E) by providing an optional CDR recovered clock output signal to the device fabric.
- Avalon Memory-Mapped (Avalon-MM) management interface to access the IP core control and status registers.
- Avalon-ST data path interface connects to client logic with the start of frame in the most significant byte (MSB) when optional adapters are used. Interface has data width 256 or 512 bits depending on the data rate.
- Optional custom streaming data path interface with narrower bus width and a start frame possible on 64-bit word boundaries without the optional adapters. Interface has data width 128 or 256 bits depending on the data rate.
- Support for jumbo packets.
- TX and RX CRC pass-through control.
- Optional TX CRC generation and insertion.

- RX CRC checking and error reporting.
- TX error insertion capability supports test and debug.
- RX and TX preamble pass-through options for applications that require proprietary user management information transfer.
- TX automatic frame padding to meet the 64-byte minimum Ethernet frame length at the LL 40-100GbE Ethernet connection.
- Hardware and software reset control.
- Pause frame filtering control.
- Received control frame type indication.
- MAC provides cut-through frame processing.
- Optional deficit idle counter (DIC) options to maintain a finely controlled 8-byte or 12-byte inter-packet gap (IPG) minimum average.
- Optional IEEE 802.3 Clause 31 Ethernet flow control operation using the pause registers or pause interface.
- Optional priority-based flow control that complies with the *IEEE Standard 802.1Qbb-2011—Amendment 17: Priority-based Flow Control*, using the pause registers for fine control.
- RX PCS lane skew tolerance that exceeds the IEEE 802.3-2012 Ethernet standard clause 82.2.12 requirements: 1900 bits RX lane skew tolerance for LL 40GbE IP cores and 1000 bits RX lane skew tolerance for LL 100GbE IP cores.
- Optional support for the IEEE Standard 1588-2008 Precision Clock Synchronization Protocol (1588 PTP).
- Optional statistics counters.
- Optional fault signaling: detects and reports local fault and generates remote fault, with *IEEE 802.3ba-2012 Ethernet Standard* Clause 66 support.
- Optional serial PMA loopback (TX to RX) at the serial transceiver for self-diagnostic testing.
- Optional access to Altera Debug Master Endpoint (ADME) for debugging or monitoring PHY signal integrity.

The LL 40-100GbE IP core can support full wire line speed with a 64-byte frame length and back-to-back or mixed length traffic with no dropped packets.

For a detailed specification of the Ethernet protocol refer to the *IEEE 802.3ba-2010 High Speed Ethernet Standard*.

## Low Latency 40-100GbE IP Core Device Family and Speed Grade Support

The following sections list the device family and device speed grade support offered by the Low Latency 40-100GbE IP core:

[Device Family Support](#) on page 1-5

[Low Latency 40-100GbE IP Core Device Speed Grade Support](#) on page 1-5

## Device Family Support

**Table 1-1: Altera IP Core Device Support Levels**

Device Support Level	Definition
<b>Preliminary</b>	The IP core is verified with preliminary timing models for this device family. The IP core meets all functional requirements, but might still be undergoing timing analysis for the device family. It can be used in production designs with caution.
<b>Final</b>	The IP core is verified with final timing models for this device family. The IP core meets all functional and timing requirements for the device family and can be used in production designs.

**Table 1-2: Low Latency 40-100GbE IP Core Device Family Support**

Shows the level of support offered by the Low Latency 40-100GbE IP core for each Altera device family.

Device Family	Support
Stratix V (GX, GT, and GS)	Final
Arria 10 (GX, GT, and GS)	Refer to What's New in IP webpage
Other device families	Not supported

### Related Information

- [Low Latency 40-100GbE IP Core Device Speed Grade Support](#) on page 1-5
- [What's New in IP](#)  
Information about the device support level in the current release of the Quartus Prime software.

## Low Latency 40-100GbE IP Core Device Speed Grade Support

**Table 1-3: Slowest Supported Device Speed Grades**

Lists the slowest supported device speed grades for standard variations of the Low Latency 40-100GbE IP core. IP core variations that include a 1588 PTP module might require Quartus Prime seed sweeping to achieve a comfortable timing margin.

MegaCore Function	Device Family	Supported Speed Grades
40GbE	Stratix V (GX)	I3, C3
	Stratix V (GT)	I3, C2
	Stratix V (GS)	I3, C3
	Arria 10 (GX, GT, GS)	I2, C2
40GbE (40GBASE-KR4 option)	Arria 10 (GX, GT, GS)	I2, C2
100GbE	Stratix V (GX)	I2, C2
	Stratix V (GT)	I2, C2
	Stratix V (GS)	I2, C2
	Arria 10 (GX, GT, GS)	I2, C2
100GbE (CAUI-4 option)	Arria 10 GT	I2, C2

## IP Core Verification

To ensure functional correctness of the Low Latency 40-100GbE IP core, Altera performs extensive validation through both simulation and hardware testing. Before releasing a version of the Low Latency 40- and 100-Gbps Ethernet MAC and PHY IP core, Altera runs comprehensive regression tests in the current or associated version of the Quartus Prime software.

### Related Information

- [Knowledge Base Errata for Low Latency 40-100GbE IP core](#)  
Exceptions to functional correctness are documented in the Low Latency 40-100GbE IP core errata.
- [Altera IP Release Notes](#)  
Changes to the Low Latency 40-100GbE IP core are noted in the Altera IP Release Notes starting from the Quartus II software v14.0 Arria 10 Edition.

## Simulation Environment

Altera performs the following tests on the Low Latency 40-100GbE MAC and PHY IP core in the simulation environment using internal and third party standard bus functional models (BFM):

- Constrained random tests that cover randomized frame size and contents
- Randomized error injection tests that inject Frame Check Sequence (FCS) field errors, runt packets, and corrupt control characters, and then check for the proper response from the IP core
- Assertion based tests to confirm proper behavior of the IP core with respect to the specification
- Extensive coverage of our runtime configuration space and proper behavior in all possible modes of operation

## Compilation Checking

Altera performs compilation testing on an extensive set of Low Latency 40-100GbE MAC and PHY IP core variations and designs that target different devices, to ensure the Quartus Prime software places and routes the IP core ports correctly.

## Hardware Testing

Altera performs hardware testing of the key functions of the Low Latency 40-100GbE MAC and PHY IP core using standard 40-100Gbps Ethernet network test equipment and optical modules. The Altera hardware tests of the Low Latency 40-100GbE IP core also ensure reliable solution coverage for hardware related areas such as performance, link synchronization, and reset recovery. The IP core is tested with Stratix V devices.

## Performance and Resource Utilization

The following sections provide performance and resource utilization data for the Low Latency 40GbE and 100GbE IP cores.

**Table 1-4: IP Core Variation Encoding for Resource Utilization Tables**

"On" indicates the parameter is turned on. The symbol "—" indicates the parameter is turned off or not available.

IP Core Variation	A	B	C	D	E	F
Parameter						
<b>Data interface</b>	Custom-ST	Avalon-ST	Avalon-ST	Avalon-ST	Avalon-ST	Avalon-ST
<b>Flow control mode</b>	No flow control	No flow control	Standard flow control	Standard flow control	No flow control	No flow control
<b>Average interpacket gap</b>	12	12	12	12	12	12
<b>Enable 1588 PTP</b>	—	—	—	On	—	—

IP Core Variation	A	B	C	D	E	F
Parameter						
Enable link fault generation	—	—	On	On	—	—
Enable TX CRC insertion	—	On	On	On	On	On
Enable preamble passthrough	—	—	On	On	—	—
Enable alignment EOP on FCS word	—	On	On	On	On	On
Enable TX statistics	—	On	On	On	On	On
Enable RX statistics	—	On	On	On	On	On
Enable KR4	—	—	—	—	On	On
Include FEC sublayer	—	—	—	—	—	On

## Stratix V Resource Utilization for Low Latency 40-100GbE IP Cores

Resource utilization changes depending on the parameter settings you specify in the Low Latency 40-100GbE parameter editor. For example, if you turn on pause functionality or statistics counters in the LL 40-100GbE parameter editor, the IP core requires additional resources to implement the additional functionality.

**Table 1-5: IP Core FPGA Resource Utilization in Stratix V Devices**

Lists the resources and expected performance for selected variations of the Low Latency 40-100GbE IP cores in a Stratix V device.

These results were obtained using the Quartus II v14.1 software.

- The numbers of ALMs and logic registers are rounded up to the nearest 100.
- The numbers of ALMs, before rounding, are the **ALMs needed** numbers from the Quartus II Fitter Report.

40GbE Variation	ALMs	Dedicated Logic Registers	Memory M20K
40GbE variation A	5300	12800	13
40GbE variation B	9900	21500	13
40GbE variation C	10900	24100	13
40GbE variation D	14000	31000	17

100GbE Variation	ALMs	Dedicated Logic Registers	Memory M20K
100GbE variation A	9500	23000	29
100GbE variation B	20900	48400	61
100GbE variation C	22100	52500	61
100GbE variation D	26900	63700	65

The following sections explain how to install, parameterize, simulate, and initialize the Low Latency 40-100GbE IP core:

### [Installation and Licensing for LL 40-100GbE IP Core for Stratix V Devices](#) on page 2-2

The Low Latency 40-100GbE IP core that targets a Stratix V device is an extended IP core which is not included with the Quartus Prime release. This section provides a general overview of the Altera extended IP core installation process to help you quickly get started with any Altera extended IP core.

### [Licensing IP Cores](#) on page 2-3

The Low Latency 40-100GbE IP core that targets an Arria 10 device is a standard Altera IP core in the Altera IP Library.

### [Specifying the Low Latency 40-100GbE IP Core Parameters and Options](#) on page 2-4

The LL 40-100GbE IP core for Arria 10 devices supports a standard customization and generation process from the Quartus Prime IP Catalog. After you install and integrate the extended IP core in the ACDS release, the LL 40-100GbE IP core for Stratix V devices also supports the standard customization and generation process. The Low Latency 40-100GbE IP core is not supported in Qsys.

### [IP Core Parameters](#) on page 2-5

The Low Latency 40-100GbE parameter editor provides the parameters you can set to configure the Low Latency 40-100GbE IP core and simulation and hardware design examples.

### [Files Generated for Stratix V Variations](#) on page 2-14

The Quartus Prime software generates the following output for your Stratix V LL 40-100GbE IP core.

### [Files Generated for Arria 10 Variations](#) on page 2-15

The Quartus Prime software generates the following IP core output file structure when targeting Arria 10 devices.

### [Integrating Your IP Core in Your Design](#) on page 2-18

### [Low Latency 40-100GbE IP Core Testbenches](#) on page 2-23

Altera provides a testbench, a hardware design example, and a compilation-only example design with most variations of the Low Latency 40-100GbE IP core. The testbench is available for simulation of your IP core, and the hardware design example can be run on hardware. You can run the testbench to observe the IP core behavior on the various interfaces in simulation.

### [Simulating the Low Latency 40-100GbE IP Core With the Testbenches](#) on page 2-28

### [Compiling the Full Design and Programming the FPGA](#) on page 2-32

### [Initializing the IP Core](#) on page 2-32

## Installation and Licensing for LL 40-100GbE IP Core for Stratix V Devices

The Low Latency 40-100GbE IP core that targets the Stratix V device family is an extended IP core which is not included with the Quartus Prime release. This section provides a general overview of the Altera extended IP core installation process to help you quickly get started with any Altera extended IP core.

The Altera extended IP cores are available from the Altera Self-Service Licensing Center (SSLC). Refer to Related Links below for the correct link for this IP core.

**Figure 2-1: IP Core Directory Structure**

Directory structure after you install the Low Latency 40-100GbE IP core. The default installation directory `<path>` on Windows is `C:\altera\< version number >`; on Linux it is `/opt/altera< version number >`.

You can evaluate an IP core in simulation and in hardware until you are satisfied with its functionality and performance. You must purchase a license for the IP core when you want to take your design to production. After you purchase a license for an Altera IP core, you can request a license file from the Altera Licensing page of the Altera website and install the license on your computer.

**Related Information**

- [Altera website](#)
- [Altera Licensing website](#)

- **Altera Self-Service Licensing Center**

After you purchase the Low Latency 40-100GbE IP core that supports Stratix V devices, the IP core is available for download from the SSLC page in your myAltera account. Altera requires that you create a myAltera account if you do not have one already, and log in to access the SSLC. On the SSLC page, click Run for this IP core. The SSLC provides an installation dialog box to guide your installation of the IP core.

## Licensing IP Cores

The Altera IP Library provides many useful IP core functions for your production use without purchasing an additional license. Some Altera MegaCore IP functions require that you purchase a separate license for production use. However, the OpenCore® feature allows evaluation of any Altera IP core in simulation and compilation in the Quartus Prime software. After you are satisfied with functionality and performance, visit the Self Service Licensing Center to obtain a license number for any Altera product.

**Figure 2-2: IP Core Installation Path**

**Note:** The default IP installation directory on Windows is `<drive>:\altera\<version number>`; on Linux the IP installation directory is `<home directory>/altera/ <version number>`.

## OpenCore Plus IP Evaluation

Altera's free OpenCore Plus feature allows you to evaluate licensed MegaCore IP cores in simulation and hardware before purchase. You only need to purchase a license for MegaCore IP cores if you decide to take your design to production. OpenCore Plus supports the following evaluations:

- Simulate the behavior of a licensed IP core in your system.
- Verify the functionality, size, and speed of the IP core quickly and easily.
- Generate time-limited device programming files for designs that include IP cores.
- Program a device with your IP core and verify your design in hardware.

OpenCore Plus evaluation supports the following two operation modes:

- Untethered—run the design containing the licensed IP for a limited time.
- Tethered—run the design containing the licensed IP for a longer time or indefinitely. This requires a connection between your board and the host computer.

**Note:** All IP cores that use OpenCore Plus time out simultaneously when any IP core in the design times out.

## Specifying the Low Latency 40-100GbE IP Core Parameters and Options

The Low Latency 40-100GbE parameter editor allows you to quickly configure your custom IP variation. Use the following steps to specify IP core options and parameters in the Quartus Prime software.

1. In the IP Catalog (**Tools > IP Catalog**), select a target device family.
2. In the IP Catalog, locate and double-click the name of the IP core to customize. The New IP Variation window appears.
3. Specify a top-level name for your custom IP variation. The parameter editor saves the IP variation settings in a file named `<your_ip>.qsys` (for Arria 10 variations) or `<your_ip>.qip` (for Stratix V variations).
4. If your IP core targets the Arria 10 device family, you must select a specific device in the **Device** field or maintain the default device the Quartus Prime software lists. If you target a specific Altera development kit, the hardware design example overwrites the selection with the device on the target board.
5. Click **OK**. The parameter editor appears.
6. Specify the parameters and options for your IP variation in the parameter editor, including one or more of the following. Refer to your IP core user guide for information about specific IP core parameters.
  - Specify parameters defining the IP core functionality, port configurations, and device-specific features.
  - Specify options for processing the IP core files in other EDA tools.
7. For Arria 10 variations, follow these steps:
  - a. Optionally, to generate a simulation testbench or example project, follow the instructions in [Generating the Low Latency 40-100GbE Testbench](#) on page 2-29.
  - b. Click **Generate HDL**. The **Generation** dialog box appears.
  - c. Specify output file generation options, and then click **Generate**. The IP variation files generate according to your specifications.
  - d. Click **Finish**. The parameter editor adds the top-level `.qsys` file to the current project automatically. If you are prompted to manually add the `.qsys` file to the project, click **Project > Add/Remove Files in Project** to add the file.
8. For Stratix V variations, follow these steps:
  - a. Click **Finish**.
  - b. Optionally, to generate a simulation testbench or example project, follow the instructions in [Generating the Low Latency 40-100GbE Testbench](#) on page 2-29.

After you click Finish and optionally follow the additional step to generate a simulation testbench and example project, if available for your IP core variation, the parameter editor adds the top-level `.qsys` file or top-level `.qip` file to the current project automatically. If you are prompted to manually add the `.qip` file to the project, click **Project > Add/Remove Files in Project** to add the file.
9. After generating and instantiating your IP variation, make appropriate pin assignments to connect ports.

## IP Core Parameters

The Low Latency 40-100GbE parameter editor provides the parameters you can set to configure the Low Latency 40-100GbE IP core and simulation and hardware design examples.

LL 40-100GbE IP core variations that target an Arria 10 device include an **Example Design** tab.

**Table 2-1: Low Latency 40-100GbE Parameters: Main Tab**

Describes the parameters for customizing the 40-100GbE IP core on the Main tab of the 40-100GbE parameter editor.

Parameter	Type	Range	Default Setting	Parameter Description
<b>General Options</b>				
<b>Device family</b>	String	<ul style="list-style-type: none"> <li>Stratix V</li> <li>Arria 10</li> </ul>	According to the setting in the project or IP Catalog settings.	Selects the device family.
<b>Protocol speed</b>	String	<ul style="list-style-type: none"> <li>40 GbE</li> <li>100 GbE</li> </ul>	100 GbE	Selects the MAC datapath width.
<b>Data interface</b>	String	<ul style="list-style-type: none"> <li>Custom-ST</li> <li>Avalon-ST</li> </ul>	Avalon-ST	<p>Selects the Avalon-ST interface or the narrower, custom streaming client interface to the MAC.</p> <p>If you select the custom streaming client interface, the <b>Flow control mode</b> and <b>Enable 1588 PTP</b> parameters are not available.</p>
<b>PCS/PMA Options</b>				
<b>Enable CAUI4 PCS</b> <sup>(1)(2)</sup>	Boolean	<ul style="list-style-type: none"> <li>True</li> <li>False</li> </ul>	False	If turned on, the IP core is a 100GbE CAUI-4 variation, with four 25.78125 Gbps transceiver PHY links.

<sup>(1)</sup> The **Enable CAUI4 PCS** parameter is disabled when **Protocol speed** is set to 100GbE and **Device family** is not Arria 10, and when **Protocol speed** is set to 40GbE. If the parameter is disabled, the IP core is configured with the regular 100 Gbps PHY link option of 10 x 10.3125 Gbps.

<sup>(2)</sup> For the **Device family** parameter, the CAUI-4 option requires the Arria 10 device.

Parameter	Type	Range	Default Setting	Parameter Description
<b>Enable SyncE</b>	Boolean	<ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul>	False	<p>Exposes the RX recovered clock as an output signal. This feature supports the Synchronous Ethernet standard described in the ITU-T G.8261, G.8262, and G.8264 recommendations.</p> <p>This parameter is available only in variations that target an Arria 10 device.</p>
<b>PHY reference frequency</b>	Integer (encoding)	<ul style="list-style-type: none"> <li>• 322.265625 MHz</li> <li>• 644.53125 MHz</li> </ul>	644.53125 MHz	Sets the expected incoming PHY <code>clk_ref</code> reference frequency. The input clock frequency must match the frequency you specify for this parameter ( $\pm 100$ ppm).
<b>Use external TX MAC PLL</b>	Boolean	<ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul>	False	If you turn this option on, the IP core is configured to expect an input clock to drive the TX MAC. The input clock signal is <code>clk_txmac_in</code> .
<b>Flow Control Options</b>				
<b>Flow control mode</b>	String	<ul style="list-style-type: none"> <li>• No flow control</li> <li>• Standard flow control</li> <li>• Priority-based flow control</li> </ul>	No flow control	<p>Configures the flow control mechanism the IP core implements. Standard flow control is Ethernet standard flow control.</p> <p>If you select the custom streaming client interface, the IP core must be configured with no flow control, and this parameter is not available.</p>
<b>Number of PFC queues</b>	Integer	1–8	8	Number of distinct priority queues for priority-based flow control. This parameter is available only if you set <b>Flow control mode</b> to <b>Priority-based flow control</b> .

Parameter	Type	Range	Default Setting	Parameter Description
<b>Average interpacket gap</b>	String	<ul style="list-style-type: none"> <li>• Disable deficit idle counter</li> <li>• 8</li> <li>• 12</li> </ul>	12	<p>If you set the value of this parameter to <b>8</b> or to <b>12</b>, the IP core includes a deficit idle counter (DIC), which maintains an average interpacket gap (IPG) of 8 or 12, as you specify. If you set the value of this parameter to <b>Disable deficit idle counter</b>, the IP core is configured without the DIC, and does not maintain the required minimum average IPG. The Ethernet standard requires a minimum average IPG of 12. Turning off <b>Average interpacket gap</b> increases bandwidth.</p>
<b>MAC Options</b>				
<b>Enable 1588 PTP</b>	Boolean	<ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul>	False	<p>If turned on, the IP core supports the IEEE Standard 1588-2008 Precision Clock Synchronization Protocol, by providing the hooks to implement the Precise Timing Protocol (PTP).</p> <p>If you select the custom streaming client interface, the IP core must be configured without 1588 support, and this parameter is not available.</p>
<b>Enable 96b Time of Day Format</b>	Boolean	<ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul>	True	<p>Include the 96-bit interface to the TOD module. If you turn on this parameter, the TOD module that is generated with the IP core has a matching 96-bit timestamp interface.</p> <p>If <b>Enable 1588 PTP</b> is turned on, you must turn on at least one of <b>Enable 96b Time of Day Format</b> and <b>Enable 64b Time of Day Format</b>. You can turn on both <b>Enable 96b Time of Day Format</b> and <b>Enable 64b Time of Day Format</b> to generate a TOD interface for each format.</p> <p>This parameter is available only in variations with <b>Enable 1588 PTP</b> turned on.</p>

Parameter	Type	Range	Default Setting	Parameter Description
<b>Enable 64b Time of Day Format</b>	Boolean	<ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul>	False	<p>Include the 64-bit interface to the TOD module. If you turn on this parameter, the TOD module that is generated with the IP core has a matching 64-bit timestamp interface.</p> <p>If <b>Enable 1588 PTP</b> is turned on, you must turn on at least one of <b>Enable 96b Time of Day Format</b> and <b>Enable 64b Time of Day Format</b>. You can turn on both <b>Enable 96b Time of Day Format</b> and <b>Enable 64b Time of Day Format</b> to generate a TOD interface for each format.</p> <p>This parameter is available only in variations with <b>Enable 1588 PTP</b> turned on.</p>
<b>Timestamp fingerprint width</b>	Integer	1–16	1	<p>Specifies the number of bits in the fingerprint that the IP core handles.</p> <p>This parameter is available only in variations with <b>Enable 1588 PTP</b> turned on.</p>
<b>Enable link fault generation</b>	Boolean	<ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul>	False	<p>If turned on, the IP core includes the link fault signaling modules and relevant signals. If turned off, the IP core is configured without these modules and without these signals. Turning on link fault signaling provides your design a tool to improve reliability, but increases resource utilization.</p>

Parameter	Type	Range	Default Setting	Parameter Description
<b>Enable TX CRC insertion</b>	Boolean	<ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul>	True	<p>If turned on, the IP core inserts a 32-bit Frame Check Sequence (FCS), which is a CRC-32 checksum, in outgoing Ethernet frames. If turned off, the IP core does not insert the CRC-32 sequence in outgoing Ethernet communication. Turning on TX CRC insertion improves reliability but increases resource utilization and latency through the IP core.</p> <p>If you turn on flow control, the IP core must be configured with TX CRC insertion, and this parameter is not available.</p>
<b>Enable preamble passthrough</b>	Boolean	<ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul>	False	<p>If turned on, the IP core is in RX and TX preamble pass-through mode. In RX preamble pass-through mode, the IP core passes the preamble and SFD to the client instead of stripping them out of the Ethernet packet. In TX preamble pass-through mode, the client specifies the preamble to be sent in the Ethernet frame.</p>
<b>Enable alignment EOP on FCS word</b>	Boolean	<ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul>	True	<p>If turned on, the IP core aligns the 32-bit Frame Check Sequence (FCS) error signal with the assertion of the EOP by delaying the RX data bus to match the latency of the FCS computation. If turned off, the IP core does not delay the RX data bus to match the latency of the FCS computation. If the parameter is turned off, the FCS error signal, in the case of an FCS error, is asserted in a later clock cycle than the relevant assertion of the EOP signal.</p> <p>Altera recommends that you turn on this option. Otherwise, the latency between the EOP indication and assertion of the FCS error signal is non-deterministic.</p> <p>You must turn on this parameter if your design relies on the <code>rx_inc_octetsOK</code> signal.</p>

Parameter	Type	Range	Default Setting	Parameter Description
<b>Enable TX statistics</b>	Boolean	<ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul>	True	If turned on, the IP core includes built-in TX statistics counters. If turned off, the IP core is configured without TX statistics counters. In any case, the IP core is configured with TX statistics counter increment output vectors.
<b>Enable RX statistics</b>	Boolean	<ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul>	True	If turned on, the IP core includes built-in RX statistics counters. If turned off, the IP core is configured without RX statistics counters. In any case, the IP core is configured with RX statistics counter increment output vectors.

### Configuration, Debug and Extension Options

<b>Enable Altera Debug Master Endpoint (ADME)</b>	Boolean	<ul style="list-style-type: none"> <li>• True</li> <li>• False</li> </ul>	False	<p>If turned on, the IP core turns on the following features in the Arria 10 PHY IP core that is included in the LL 40-100GbE IP core:</p> <ul style="list-style-type: none"> <li>• <b>Enable Altera Debug Master Endpoint (ADME)</b></li> <li>• <b>Enable capability registers</b></li> </ul> <p>If turned off, the IP core is configured without these features.</p> <p>This parameter is available only in variations that target an Arria 10 device. For information about these Arria 10 features, refer to the <a href="#">Arria 10 Transceiver PHY User Guide</a>.</p>
---	---------	---	-------	---

**Table 2-2: LL 40-100GbE Parameters: 40GBASE-KR4 Tab**

Describes the parameters for customizing a 40GBASE-KR4 Low Latency 40-100GbE IP core, on the 40GBASE-KR4 tab of the LL 40-100GbE parameter editor. The parameters on this tab are available only if the following conditions hold:

- Your IP core targets an Arria 10 device. You set the target device family for your Quartus Prime project or in the Quartus Prime software before you access the IP Catalog.
- You select the value of **40GbE** for the **Protocol speed** parameter on the Main tab.
- You turn off the **Enable 1588 PTP** parameter on the Main tab.
