

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## **IQS232 Datasheet - Configurable 2 Channel sensor with Compensation for Sensitivity Reducing Objects**

### **Unparalleled Features:**

- Sub 4  $\mu$ A current consumption
- Automatic tuning for optimal operation in various environments & compensation against sensitivity reducing objects

The IQS232 ProxSense® IC is a fully integrated two channel capacitive contact and proximity sensor with market leading sensitivity and automatic tuning of the sense electrodes. The IQS232 provides a minimalist implementation requiring as few as 2 external components. The device is ready for use in a large range of applications while programming options allow customisation in specialised applications.

### **Main features:**

- 2 Channel input device
- Differentiated Touch and Distributed Proximity Electrode
- ATI: Automatic tuning to optimum sensitivity
- Supply Voltage 1.8 V to 3.6 V
- Internal voltage regulator and reference capacitor
- OTP options available
- Direct (logic level) and serial data output
- Low Power Modes (sub 4  $\mu$ A min)
- Adjustable Proximity & Touch Thresholds
- Automatic drift compensation
- Development and Programming tools available
- Small and cost effective SO-8 package

### **Applications:**

- White goods and appliances
- Remote Controls
- Office equipment, toys, sanitary ware
- Proximity detection that enables back lighting activation (Patented)
- Wake-up from standby applications
- Replacement for electro mechanical switches
- GUI trigger on proximity detection.

## 1 Functional Overview

The IQS232 is a two channel capacitive proximity and touch sensor featuring an internal voltage regular and reference capacitor (Cs). The device has two dedicated input pins for the connection of the sense electrodes (CX). Two output pins for Touch (for each channel) detection and one output (PO) for proximity detection. The output pins can be configured as Logic outputs or in a serial data streaming option on TO0 (data) and TO1 (clock). The device automatically tracks slow varying environmental changes via various filters, detect noise and has an automatic Auto Tuning Implementation (ATI) to tune the device for optimal sensitivity.

### 1.1 Pin Outs

Figure 1.1: IQS232 pin-out.

The IQS232 is pin compatible with the IQS132, but has different electrical characteristics. Refer to Section 10.

Table 1.1: IQS232 Pin-outs

Pin	Stand Alone	Streaming	Function
1	GND	GND	Ground
2	CX0	CX0	Sense Electrode
3	VDDHI	VDDHI	Power Input
4	VREG	VREG	Regulator Pin
5	PO/RF	RDY/RF	Proximity Output
6	TO0	SDA	Touch Output
7	TO1	SCL	Touch Output
8	CX1	CX1	Sense Electrode

## 1.2 Applicability

All specifications, except where specifically mentioned otherwise, provided by this datasheet are applicable to the following ranges:

- Temperature  $-20\text{ }^{\circ}\text{C}$  to  $+85\text{ }^{\circ}\text{C}$
- Supply voltage (VDDHI) 1.8 V to 3.6 V

- Detection of PROX and TOUCH events.
- Managing outputs of the device.
- Managing serial communications.
- Manage programming of OTP options.

## 2 Analogue Functionality

The analogue circuitry measures the capacitance of the sense electrodes attached to the Cx pins through a charge transfer process that is periodically initiated by the digital circuitry. The measuring process is referred to as a conversion and consists of the discharging of Cs and Cx, the charging of Cx and then a series of charge transfers from Cx to Cs until a trip voltage is reached. The number of charge transfers required to reach the trip voltage is referred to as the counts (CS). The capacitance measurement circuitry makes use of an internal Cs and voltage reference ( $V_{REF}$ ). The analogue circuitry further provides functionality for:

- Power on reset (POR) detection.
- Brown out detection (BOD).

## 3 Digital Functionality

The digital processing functionality is responsible for:

- Device configuration from OTP settings after POR.
- Management of BOD and WDT events.
- Initiation of conversions at the selected rate.
- Processing of CS and execution of algorithms.
- Monitoring and automatic execution of the ATI algorithm.
- Signal processing and digital filtering.

## 4 Reference Design

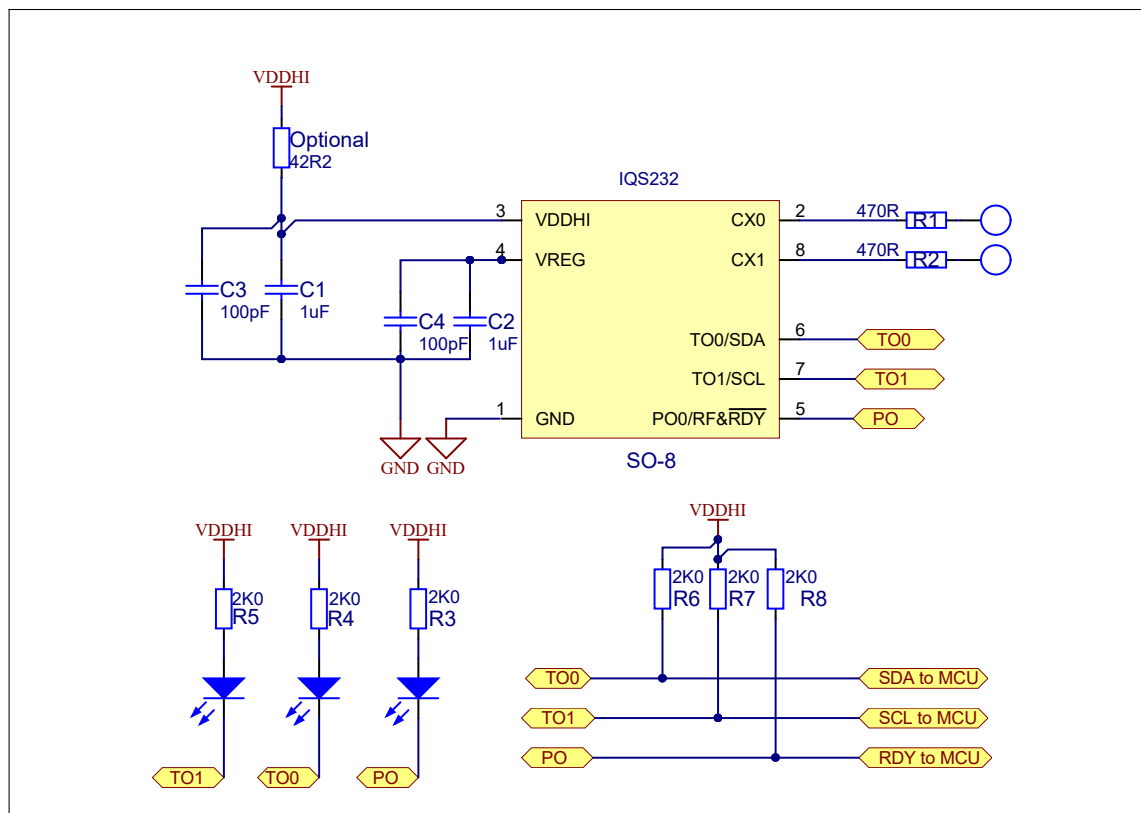

Figure 4.1: IQS232 Reference Design.

### 4.1 Power Supply and PCB Layout

Azoteq IC's provide a high level of on-chip hardware and software noise filtering and ESD protection (refer to Section 10). Designing PCB's with better noise immunity against EMI, FTB and ESD in mind, it is always advisable to keep the critical noise suppression components like the de-coupling capacitors and series resistors in Figure 4.1 as close as possible to the IC. Always maintain a good ground connection and ground pour underneath the IC. For more guidelines please refer to the relevant application notes as mentioned in Section 4.2. Where a system level ESD strike is found to cause the IC to go into ESD induced latch-up, it is suggested that the supply current to the IQS232 IC is limited by means of a series resistor that could limit the maximum supply current to the IC to <80mA.

## 4.2 Design Rules for Harsh EMC Environments

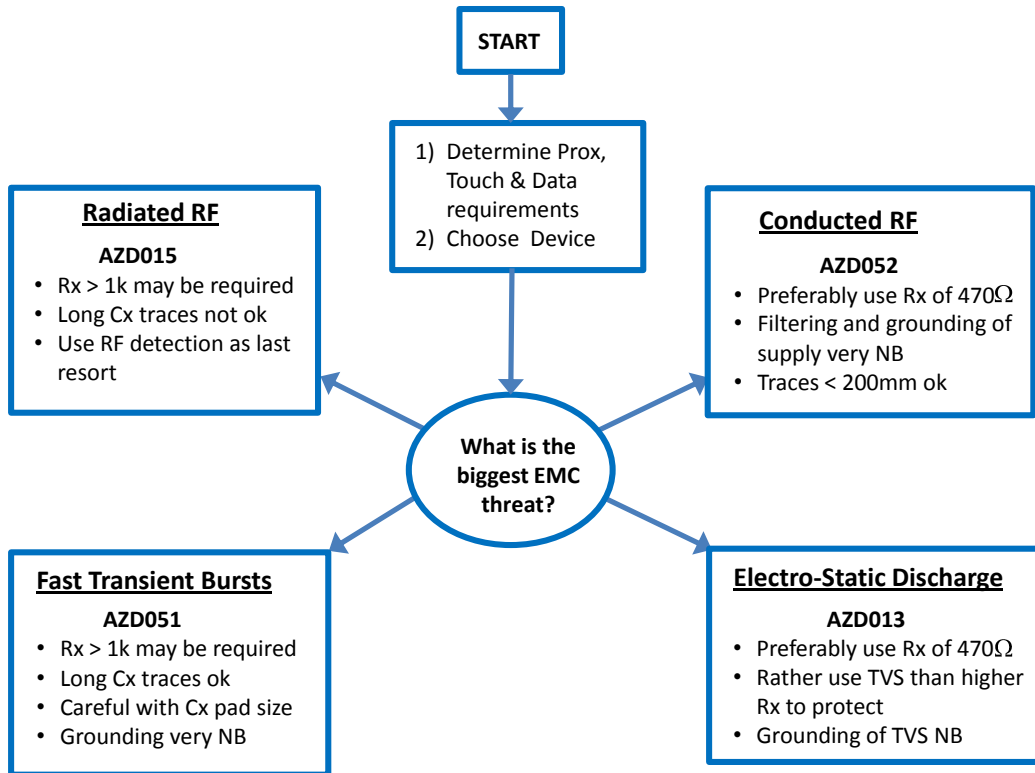

Figure 4.2: EMC Design Choices. Applicable application notes: AZD013, AZD015, AZD051, AZD052

## 5 High Sensitivity

Through patented design and advanced signal processing, the device is able to provide extremely high sensitivity to detect proximity. This enables designs to detect proximity at distances that cannot be equalled by most other products. When the device is used in environments where high levels of noise exist, a reduced proximity threshold is proposed to ensure reliable functioning of the sensor. When the capacitance between the sense electrode and ground becomes too large the sensitivity of the device may be influenced. For more guidelines on layout, please refer to Application Note AZD008, available on the Azoteq web page, visit:

[www.azoteq.com](http://www.azoteq.com)

Note AZD007: "AZD007 - USBProg Overview" which can be found on the Azoteq website. Alternate programming solutions of the IQS232 also exist. For further enquiries regarding this matter please contact Azoteq at: [ProxSenseSupport@azoteq.com](mailto:ProxSenseSupport@azoteq.com) or the local distributor.

## 6 User Configurable Options

The IQS232 provides One Time Programmable (OTP) user options (each option can be modified only once). The IQS232 can enter streaming mode (I<sup>2</sup>C debugging) at start-up where the OTP options can be set and evaluated through the memory map, refer to Section 14, before programming OTP setting for stand alone use. The device is fully functional in the default (un-configured) state. OTP options are intended for specific applications. The configuration of the device can be done on packaged devices or in-circuit. In-circuit configuration may be limited by values of external components chosen.

### 6.1 Configuring of Devices

Azoteq offers a Configuration Tool (CT220 or later) and accompanying software (USBProg.exe) that can be used to program the OTP user options for prototyping purposes. More details regarding the configuration of the device with the USBProg program is explained by Application

## 7 Description of User Options

This section describes the individual user programmable options of the IQS232 in more detail. Azoteq can supply pre-configured devices for large quantities.

Thresholds and other settings can also be evaluated in Test Mode streaming without programming the OTP options. For appropriate software, visit [www.azoteq.com](http://www.azoteq.com)

### 7.1 ATI Method

The IQS232 can be setup to start in two ways; Full ATI and Partial ATI. In Full ATI mode, the device automatically select the multipliers through the ATI algorithm to setup the IQS232 as close as possible to its default sensitivity for the environment where it was placed. The designer can, however, select Partial ATI, and set the multipliers to a pre configured value. This will cause the IQS232 to only calculate the compensation (not the compensation and multipliers as in Full ATI), which allows the freedom to make the IQS232 more or less sensitive for its intended environment of use.

### 7.2 Touch Base Values

The IQS232 has the option to change the Base Values of the touch channels during the ATI algorithm. Depending on the application, this provides the user with another option to select the sensitivity of the touch channels (along with the touch thresholds, charge transfer frequency and the target counts) without changes in the hardware (CX sizes and routing, etc) The default Base Value 250, and can be set to 100 to increase the sensitivity. The Base Value cannot be changed independently for each channel.

## 7.3 Touch Thresholds

The IQS232 has 8 touch threshold settings. The touch threshold is selected by the designer to obtain the desired touch sensitivity. The touch threshold is expressed as a fraction of the LTA as follows:

$$T_{TH} = SelectedValue \times LTA \quad (7.1)$$

Where LTA is the Long Term Average The touch event is triggered based on  $T_{THR}$ , CS and LTA. A touch event is identified when for at least 2 consecutive samples of the following equation holds:

$$T_{THR} = < LTA - CS \quad (7.2)$$

With lower average CS (therefore lower LTA) values the touch threshold will be lower and vice versa. Changing the target counts of the touch channels, will also change the value of the LTA, which affect the counts required for a touch event. The Touch Threshold for CH0 & CH2 is set in Bank 0, while the Touch Threshold for CH1 is set in Bank 1 (when in full ATI-mode). This enables the designer to set the blocking channel's touch threshold independently from the other two channels, when not using the Partial ATI feature.

### 7.4 Proximity Threshold

The IQS232 has 4 proximity threshold settings. The proximity threshold is selected by the designer to obtain the desired sensitivity and noise immunity. The proximity event is triggered based on the selected proximity threshold; the CS and LTA (Long Term Average). The threshold is expressed in terms of counts; the same as CS. For a proximity event, the CS (counts) of the prox channel should fall the  $P_{THR}$  value below the LTA for at least 6 consecutive samples.

## 7.5 Halt time

The Halt Timer is started when a proximity or touch event occurs and is restarted when an event is removed or reoccurs. When a proximity condition occurs on any of the channels, the LTA for that channel will be "halted", thus its value will be kept fixed, until the proximity event is cleared, or the halt timer reaches the halt time. The Halt timer will count to the selected Halt time ( $t_{HALT}$ ). If the timer expires, all outputs will be cleared. It is possible that the CS could be outside the ATI band (Target  $\pm 160$  or  $\pm 80$ ) when the timer expires, which will cause a re-ATI event. The designer needs to select a Halt Timer value to best accommodate the required application.

**20 seconds** The halt timer will halt for 20 seconds after the last proximity or touch event.

**40 seconds** The halt timer will halt for 40 seconds after the last proximity or touch event.

**Never** With the Never Halt option, the filter will not halt when any proximity or touch condition occurs. This means the LTA will follow the CS and an event will clear when LTA reaches below the CS + threshold value.

**Always** With the 'ALWAYS' option, the detection of a proximity event will halt the LTA for only 40 seconds and with the detection of a touch event will halt the LTA for as long as the touch condition applies.

## 7.6 Proximity Base Value

The IQS232 has the option to change the Base Value of the distributed Proximity channel during the ATI algorithm. Depending on the application, this provides the user with another op-

tion to select the sensitivity of the proximity detection without changes in the hardware (CX sizes and routing, etc). There are 4 available options, with another 4 options becoming available when the BASESEL bit is set to alternative.

## 7.7 Sensitivity Multipliers

Sensitivity multipliers are added after the base value is selected through the base multipliers. If the sensitivity multipliers are selected high, the ATI algorithm could reach the target counts without adding any compensation, thus rendering the device less sensitive. For the same reasoning, setting the sensitivity multipliers low, will add more compensation, and increase the device sensitivity.

## 7.8 Base Multipliers

Base multipliers selects the base value of the ATI algorithm. Thus, if lower values are selected, the algorithm needs to add more sensitivity multipliers and compensation to reach the target counts, rendering the device more sensitive. For the same reasoning, the device will be less sensitive when using higher base multipliers. Care should be taken when setting the base multipliers low, as setting them to low, could cause the algorithm not to reach the target. Not reaching the target impact the touch thresholds, as the are derived from the LTA.

## 7.9 Base Select

The Base Select bit, changes the values of the proximity channel's base value options. This allows for a different range of available options, as illustrated in Table 7.9.

**Table 7.1: Distributed proximity channel's base values.**

Base Select		
0	1	
200	150	Base1:Base0
50	350	
100	500	
250	700	

### 7.10 Charge Transfer Frequency

The IQS232 has two available for the charge transfer frequency. The default (512kHz) is more sensitive, while the 1MHz option allows for better immunity against false detection in applications where moisture could be present near the sense electrodes. The faster frequency is recommended for better stability and response rate in applications with very thin overlays.

### 7.11 Streaming mode

There is a streaming bit available that allows for serial data communication on the IQS232. Streaming is done via an I<sup>2</sup>C<sup>TM</sup> compatible 3-wire interface, which consist of a data (SDA), clock (SCL) and ready (RDY) line. The IQS232 can only function as a slave on the bus, and will only acknowledge on address 0x44H. The RDY line is to be used by the host controller as an indication of when to start communication to the device. The RDY line will be low when it is ready for communication, and it will high when it is doing conversions. The IQS232 will not ack on its address while the RDY line is high (thus while the IQS232 is doing conversions).

### 7.12 Noise Detect

The IQS232 has advanced immunity to RF noise sources such as GSM cellular telephones, DECT, Bluetooth and WIFI devices.

Design guidelines should however be followed to ensure the best noise immunity. Notes for layout:

- ❑ A ground plane should be placed under the IC, except under the Cx lines
- ❑ Place the sensor IC as close as possible to the sense electrodes.
- ❑ All the tracks on the PCB must be kept as short as possible.
- ❑ The capacitor between VDDHI and GND as well as between VREG and GND must be placed as close as possible to the IC.
- ❑ A 100 pF capacitor can be placed in parallel with the 1uF capacitor between VDDHI and GND. Another 100 pF capacitor can be placed in parallel with the 1uF capacitor between VREG and GND.
- ❑ When the device is too sensitive for a specific application a parasitic capacitor (max 5pF) can be added between the CX line and ground.
- ❑ Proper sense electrode and button design principles must be followed.
- ❑ Unintentional coupling of sense electrode to ground and other circuitry must be limited by increasing the distance to these sources.
- ❑ In some instances a ground plane some distance from the device and sense electrode may provide significant shielding from undesirable interference.

However, if interference from RF noise sources persist after proper layout, see Application NoteAZD015, the IQS232 has a noise detect function which will detect RF noise and block outputs from the device. Different antenna layouts can be used on the RF detect pin (pin

6) and more details can be found in Application Note AZD015.

### 7.13 Low Power Mode

The IQS232 IC has four power modes specifically designed to reduce current consumption for battery applications. The power modes are implemented around the occurrence of charge cycle every  $t_{SAMPLE}$  seconds (refer to Table 7.2). Lower sampling frequencies yield lower power consumption (but decreased response time). During normal operation charge cycles are initiated approximately every 32ms. This is referred to as Normal Power Mode (NP). The IQS232 by default, (before programming OTP options for power modes) charges in Boost Power Mode (9ms). The timings for all the Power Modes are provided in the table below. While in any power mode the device will zoom to BP whenever a sampled count indicates a possible proximity or touch event. This improves the response time. The device will remain in BP for  $t_{ZOOM}$  and then return to the selected power mode if no further events are detected. The Zoom function allows reliable detection of events with counts being produced at the BP rate. The time,  $t_{ZOOM}$ , is 5 seconds, however, the timer will restart upon undebounced events. This could make the time,  $t_{ZOOM}$ , appear longer in noisy environments.

**Table 7.2: IQS232 Low Power Mode Timings**

Power Mode	$t_{SAMPLE}$ (ms)
$t_{BP}$ (default)	9
$t_{NP}$	32
$t_{LP1}$	128
$t_{LP2}$	1000

**Figure 7.1: LP Modes: Charge cycles.**

## 7.14 Guard Channel

When the guard channel (or blocking channel) is enabled, the other touch outputs from the device are blocked when a touch condition is detected on CH1 (CH1's touch output is still active). This can prevent accidental activation when picking up a product, or give a blocking function against water or other environmental factors.

## 7.15 Output Logic Select

The IQS232 can be set to sink or source current in stand-alone mode, by setting the logic output active high or active low. For characterisation data, please refer to Table 10.3. When used in Active Low mode, the I/O's are defined as software open drain, and requires a 10k pull up resistor to VDDHI.

## 7.16 ATI Delay

The IQS232 allows an ATI delay option of 0 seconds (immediately) or 10 seconds after the Proximity output is cleared (and the counts are not within the allowed ATI band).

## 7.17 ATI Target

The default target counts of the IQS232 are 1000 for the proximity channel, and 500 for the touch channels. However, for some application, a less sensitive and lower target is acceptable, which will also increase the response rate.

Therefore, the ATI Target bit can be set, changing the targets to 500 for the proximity channel, and 250 for the touch channels.

## 8 Charge Transfers

The IQS232 samples in 3 time slots, with one internal  $C_S$  capacitor. The charge sequence is shown in 8.1, where CH0 is the Proximity channel, and charges before each of the 2 touch channels. The proximity channel is realised by connecting both sense electrodes with internal switches. Therefore: CH0 is a distributed electrode formed by the 2 touch electrodes.

Figure 8.1: Charge Transfer for IQS232.

## 9 Auto Tuning Implementation

ATI is a sophisticated technology implemented in all but the first generation ProxSense® devices that optimises the performance of the sensor in a wide range of applications and environmental conditions refer to Application Note AZD027, AZD027 - Auto Tuning Implementation. ATI makes adjustments through internal reference capacitors to obtain optimum performance. ATI adjusts internal circuitry according to two parameters, the ATI multipliers and the ATI compensation. The ATI multiplier can be viewed as a course adjustment and the ATI compensation as a fine adjustment. The adjustment of the ATI parameters will result in variations in the counts and sensitivity. Sensitivity can be observed as the change in counts as the result of a fixed change in sensed capacitance. The ATI parameters have been chosen to provide significant overlap. It may therefore be possible to select various combinations of ATI multiplier and ATI compensation settings to obtain the same counts. The sensitivity of the various options may however be different for the same counts.

### 9.1 Full ATI

The IQS232 implements an automatic ATI algorithm. This algorithm automatically adjusts the ATI parameters to optimise the sense electrodes connection to the device. The device will execute the ATI algorithm whenever the device starts-up and when the counts are not within a predetermined range. While the Automatic ATI algorithm is in progress this condition will be indicated in the streaming data and proximity and touch events cannot be detected. The device will only briefly remain in this condition and it will be entered only when relatively large shifts in the counts has been detected. The automatic ATI function aims to keep the counts constant, regardless of the capacitance of the sense elec-

trode (within the maximum range of the device). The effects of auto-ATI on the application are the following:

- ❑ Automatic adjustment of the device configuration and processing parameters for a wide range of PCB and application designs to maintain an optimal configuration for proximity and touch detection.
- ❑ Automatic tuning of the sense electrodes at start-up to optimise the sensitivity of the application.
- ❑ Automatic re-tuning when the device detects changes in the sensing electrodes capacitance to accommodate a large range of changes in the environment of the application that influences the sense electrodes.
- ❑ Re-tuning only occurs during device operation when a relatively large sensitivity reduction is detected. This is to ensure smooth operation of the device during operation.
- ❑ Re-tuning may temporarily influences the normal functioning of the device, but in most instances the effect will be hardly noticeable.
- ❑ Shortly after the completion of the re-tuning process the sensitivity of Proximity detection may be reduced slightly for a few seconds as internal filters stabilises. Automatic ATI can be implemented so effectively due to:
  - ❑ Excellent system signal to noise ratio (SNR).
  - ❑ Effective digital signal processing to remove AC and other noise.
  - ❑ The very stable core of the devices.
  - ❑ The built in capability to accommodate a large range of sense electrodes capacitance.

## 9.2 Partial ATI

If the ATI Select bit is set to Partial ATI, the touch threshold for CH2 is the same as for CH1 (see Section 7.1, CH2's touch threshold is now also set in Bank 0). If the ATI bit is not set (default), CH2 has its own touch threshold. The same applies to the Proximity channel's base value, which is not set in the first two bits of Bank 1 anymore. Instead, the first 5 bits of Bank 1, changes to Multiplier bits (both Sensitivity and Compensation). Setting the partial ATI bit is useful for production devices (after prototyping has revealed the correct setup) as it decreases the start-up time of the IC, since the full ATI algorithm is not implemented at from a cold-start.

## 10 Specifications

### Absolute Maximum Specifications

The following absolute maximum parameters are specified for the device: Exceeding these maximum specifications may cause damage to the device.

<input type="checkbox"/> Operating temperature	−20 °C to +85 °C
<input type="checkbox"/> Supply Voltage (VDDHI - GND)	3.6 V
<input type="checkbox"/> Maximum pin voltage	VDDHI + 0.5 V
<input type="checkbox"/> Maximum continuous current (for specific Pins)	2 mA
<input type="checkbox"/> Minimum pin voltage	GND - 0.5 V
<input type="checkbox"/> Minimum power-on slope	100 V /s
<input type="checkbox"/> ESD protection	±4 kV
<input type="checkbox"/> Moisture Sensitivity Level	MSL 3

**Table 10.1: IQS232 General Operating Conditions**

Description	Condition	Parameter	MIN	TYP	MAX	Unit
Supply voltage		VDDHI	1.8		3.6	V
Internal regulator output	$1.8 \leq VDDHI \leq 3.3$	VREG	1.62	1.7	1.79	V
Boost operating current	$1.8 \leq VDDHI \leq 3.3$	$I_{IQS232BP}$		148		μA
Normal operating current	$1.8 \leq VDDHI \leq 3.3$	$I_{IQS232NP}$		80		μA
Low power operating current	$1.8 \leq VDDHI \leq 3.3$	$I_{IQS232LP1}$		18		μA
Low power operating current	$1.8 \leq VDDHI \leq 3.3$	$I_{IQS232LP2}$		3.5		μA

**Table 10.2: Start-up and shut-down slope Characteristics**

Description	Condition	Parameter	MIN	MAX	Unit
POR	VDDHI Slope $\geq 100$ V/s	POR	1.2	1.6	V
BOD		BOD	1.15	1.55	V

**Table 10.3: POUT and TOUT Characteristics for each I/O**

Symbol	Description	Conditions	$I_{SOURCE}$	UNIT
VOH	Output High voltage	VDDHI = 3.3V	5	mA
Symbol	Description	Conditions	$I_{SINK}$	UNIT
VOL	Output Low voltage	VDDHI = 3.3V	10	mA

**Table 10.4: Initial Touch Times**

Description	Parameter	MIN	MAX	Unit
BP	Report Rate	20	61	ms
NP	Report Rate	63	120	ms
LP1	Report Rate	63	216	ms
LP2	Report Rate	63	1088	ms

**Table 10.5: Repetitive Touch Rates**

DESCRIPTION	Sample rate	Response Rate	UNIT
All power modes	5ms	> 15	Touches/second
All power modes	9ms	> 8	Touches/second

## 11 Mechanical Dimensions

Figure 11.1: SO 8 Package.

Table 11.1: SO-8 Package Dimensions.

Dimension	[mm]
$A_{min}$	3.75
$A_{max}$	4.15
$B_{min}$	4.73
$B_{max}$	5.13
$H_{max}$	1.80
$L_{min}$	5.70
$L_{max}$	6.30
$T_{min}$	0.30
$T_{max}$	0.70
Pitch	1.27
$W_{min}$	0.31
$W_{max}$	0.51
