

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Integrated Power Module for Small Appliance Motor Drive Applications

### Description

IRSM505-015 and IRSM515-015 are 3-phase Integrated Power Modules (IPM) designed for advanced appliance motor drive applications such as energy efficient fans and pumps. These advanced IPMs offers a combination of low  $R_{DS(on)}$  Trench FREDFET technology and the industry benchmark half-bridge high voltage, rugged driver in a familiar package. The modules are optimized for low EMI characteristics.

IRSM505-015 includes temperature feedback while IRSM515-015 does not.

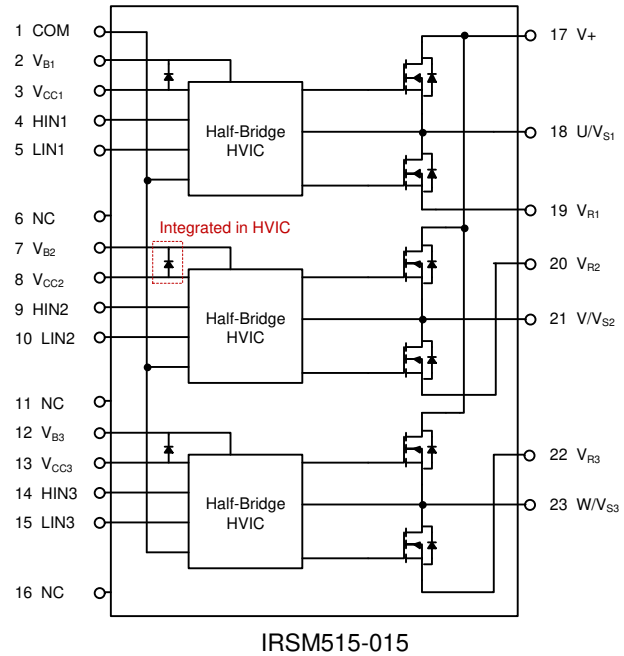

### Features

- 500V 3-phase inverter including high voltage gate drivers
- Integrated bootstrap functionality
- Low 6.0Ω (max, 25°C)  $R_{DS(on)}$  Trench FREDFET
- Under-voltage lockout for all channels
- Matched propagation delay for all channels
- Temperature feedback via NTC (IRSM505-015 only)
- Optimized dV/dt for loss and EMI trade offs
- Open-source for single and leg-shunt current sensing
- 3.3V logic compatible with advanced input filter
- Driver tolerant to negative transient voltage (-Vs)
- Isolation 1900V<sub>RMS</sub>, 1min
- RoHS Compliant
- Certified by UL - File Number E252584

### Absolute Maximum Ratings

Absolute maximum ratings indicate sustained limits beyond which damage to the module may occur. These are not tested at manufacturing. All voltage parameters are absolute voltages referenced to COM unless otherwise stated in the table.

Symbol	Description	Min	Max	Unit
$BV_{DSS}$	MOSFET Blocking Voltage	---	500	V
$I_o @ T_C=25^\circ C$	DC Output Current per MOSFET	---	1.2	A
$I_{OP} @ T_C=25^\circ C$	Pulsed Output Current per MOSFET (Note 1)	---	9	
$P_d @ T_C=25^\circ C$	Maximum Power Dissipation per MOSFET	---	18	W

**Application Notes**

A basic application schematic is shown below.

**Figure 3:** Basic sensor-less motor drive circuit connection. Motor is connected to U, V, W

A complete reference design board for running any permanent magnet motor via sensorless sinusoidal control is available. The board – photo below – features the  $\mu$ IPM™-DIP module and the iMotion™ digital control IC. Reference design kits are available on the [International Rectifier website](http://www.irf.com) (irf.com > Design Resources > Reference Designs > Intelligent Power Modules)

**Figure 4:** Reference design board featuring the  $\mu$ IPM™-DIP module and the iMotion™ IRMCF171 digital control IC

Figures 5-7 show the typical current capability for this module at specified conditions. In all tests, the application board – the IRMCS1071-1-D reference board – was placed in a box to prevent cooling from ambient airflow. Figure 5 is derived from using a heat sink that maintains  $T_C$  at 125°C. Figures 6-7 represent current capability for the module as used without any heat sink.  $\Delta T_{JA}$  represents the difference in temperature between the junction of the high-side V-phase Mosfet and the ambient, measured 10cm above and 6cm away from the board. Ambient temperature kept within 28-29°C.

**Figure 5:** Maximum sinusoidal phase current vs PWM switching frequency with a heat sink. Space Vector Modulation,  $V_+ = 320V$ ,  $T_A = 28^\circ C$ ,  $T_J = 150^\circ C$ ,  $T_C = 125^\circ C$

**Figure 6:** Maximum sinusoidal phase current vs PWM switching frequency, no heat sink. Space Vector Modulation,  $V_+ = 320V$ ,  $T_A = 28^\circ C$ ,  $T_J = 128^\circ C$

**Figure 7:** Maximum sinusoidal phase current vs PWM switching frequency, no heat sink. Space Vector Modulation,  $V_{+}=320V$ ,  $T_A=28^{\circ}C$ ,  $T_J=98^{\circ}C$

The module contains an NTC – connected between COM and the  $V_{TH}$  pin – which can be used to monitor the temperature of the module. The NTC is effectively a resistor whose value decreases as the temperature rises. The NTC resistance can be calculated at any temperature as follows:

$$R_{TH} = R_{25} e^{B \left( \frac{1}{T_{TH}} - \frac{1}{T_{25}} \right)}, \text{ where } R_{25} \text{ is } 47k\Omega \text{ and } B \text{ is } 4050K$$

An external resistor network is connected to the NTC, the simplest of which is one resistor pulled up to  $V_{CC}$  as shown in Figure 3. The  $V_{TH}$  vs NTC temperature,  $T_{TH}$  curve for this configuration is shown in Figure 8 below. The min, typical and max curves result from the NTC having a  $\pm 5\%$  tolerance on its resistance and  $\pm 2\%$  tolerance on the B-parameter.

Figure 9 shows the thermistor temperature,  $T_{TH}$  plotted against the high-side V-phase junction temperature,  $T_J$  for a module without a heat sink. It is thus advisable to shut down the module when  $T_{TH}$  reaches  $125^{\circ}C$ .

**Figure 8:**  $V_{TH}$  vs  $T_{TH}$  with  $V_{TH}$  pin pulled up to  $V_{CC}$  with a 7.50k $\Omega$  (1%, 100ppm) resistor. A 15V, 1% variation in  $V_{CC}$  is assumed.

**Figure 9:**  $T_{TH}$  vs  $T_J$  for a module without a heat sink.  $V_{CC}=15.4V$ ,  $R=7.50k\Omega$
