imall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

1. GENERAL DESCRIPTION

Nuvoton's ISD1900 ChipCorder[®] Series is a single-chip multiple-message record/playback device with dual operating modes and wide operating voltage ranging from 2.4V to 5.5V. The sampling frequency can be selected from 4 to 12 kHz via an external resistor, which also determines the duration. The device is designed for mostly standalone applications, and of course, it can be manipulated by a microcontroller, if necessary,

The two operating modes are Address Mode and Direct Mode. While in Address Mode, both record and playback operations are manipulated according to the start address and end address specified through the start address and end address pins. In Direct Mode, the device can configure the memory up to as many as eight similar duration messages, pending upon the fixed message configuration settings. With the record or playback feature being pre-selected, each message can be randomly accessed via its message control pin.

The device has a selectable differential microphone input with AGC feature or single-ended analog input. Analn. under feed-through mode. The audio output is either a differential Class-D PWM direct-drive or a single-ended voltage output (AUX out), depending on the derivative selected.

2. FEATURES

The ISD1900 is a multiple messages record/playback device with two operational modes: Address Mode and Direct Mode.

- Supply voltage: 2.4V to 5.5V.
 - Sampling Frequency 12 kHz 8 kHz 6.4 kHz 5.3 kHz 4 kHz 53.3 KΩ 80 KΩ 100 KΩ 120 KΩ 160 KΩ Rosc ISD1916 10.6 sec 16 sec 20 sec 24 sec 32 sec
- External resistor. Rosc. selects sampling frequency and duration.

21.3 sec

42.6 sec

Mic+/Mic-: differential microphone inputs.

ISD1932

ISD1964

- AGC: automatic gain control for microphone preamp circuit.
- FT: feed-through the Analn signal to the speaker outputs while Analn is converted from MIC+.
- When both FT and recording are active, device will record Analn signal into memory with Analn signal output to speaker simultaneously.

32 sec

64 sec

40 sec

80 sec

- SP+/SP-: Class-D PWM differential speaker drivers or single-ended voltage output, depending on the derivative selected.
- LED: LED is on during recording.
- Automatically power down after each operation cycle.
- Playback takes precedence over the recording operation.
- Temperature option: -40°C to +85°C (Industrial)
- Packaging: available in SOIC only

2.1. ADDRESS MODE

48 sec

96 sec

64 sec

128 sec

- While in Address Mode, flexible message duration is defined by start address and end address.
- Utilize four start address pins (S0, S1, S2 & S3) and four end address pins (E0, E1, E2 & E3) to specify the message duration.
- REC: Level-hold or Edge-trigger (toggle on-off) recording from start to end addresses.
- PlāyE: Edge-trigger playback from start to end address and stops at EOM marker, if EOM is prior to end address. Toggle on-off.
- PlāyE: Level-hold playback from start to end address. Also, if constantly Low, device will loop playback from start to end address.

2.2. DIRECT MODE

- While Direct Mode is active, utilizing the configuration pins, FMC1, FMC2 & FMC3, to define up to eight similar duration messages for random access.
- The control pins are: M1 ~ M8 (message activation) and \mathbb{R}/P (record or playback selection).
- The record or playback operation is pre-defined by the \mathbb{R}/P pin.
- Each message can be randomly accessed via its message control pin (M1 ~ M8) and the desired operation is facilitated accordingly.

		SA.	Internal pull-up & debounce existed.
V _{SSP2}	12	1/4-	Ground: Ground for negative PWM speaker driver.
▼ 55P2	13	0	SP-: Negative signal of the differential Class-D PWM speaker outputs. This
SP-			
SP- V _{CCP}	14	12	output, together with the SP+, is used to drive an 8Ω speaker directly. Speaker Power Supply: Power supply for PWM speaker drivers.

nuvoTon

PIN NAME	PIN #	I / O	FUNCTION
SP+	15	0	Depending on the derivative selected, it could be: SP+: Positive signal of the differential Class-D PWM speaker outputs. This output, together with the SP-, is used to drive an 8Ω speaker directly. Or, AUX out: single-ended voltage output.
V _{SSP1}	16	I	Ground: Ground for positive PWM speaker driver.
AGC	17	I	Automatic Gain Control (AGC): The AGC adjusts the gain of the preamplifier dynamically to compensate for the wide range of microphone input levels. The AGC allows the full range of signals to be recorded with minimal distortion. The AGC is designed to operate with a nominal capacito of 4.7 μF connected to this pin. Connecting this pin to ground (V _{SSA}) provides maximum gain to the
			preamplifier circuitry. Conversely, connecting this pin to the power supply (V_{CCA}) provides minimum gain to the preamplifier circuitry.
MIC+ / Analn	18	I	MIC+: Non-inverting input of the differential microphone signal. Analn: When FT is selected, the MIC+ input is configured to a single ended input with 1Vp-p maximum input amplitude and feed-through to the speaker outputs.
MIC- / NC	19	I	MIC-: Inverting input of the differential microphone signal. While FT is enabled, MIC- pin is disabled and must be floated.
Rosc	20	Ι	Oscillator Resistor: Connect an external resistor from this pin to V _{SSA} to select the internal sampling frequency.
V _{CCA}	21	I	Analog Power Supply: Power supply for analog circuits.
LED	22	0	LED output: During recording, this output is Low. Also, LED pulses Low momentarily at the end of playback.
PlāyĒ/FMC2	23	I	PlāyE: In Address Mode, low active input, edge-trigger playback from star to end addresses & toggle on-off. Debounce & internal pull-up existed. FMC2: When Direct Mode is active, FMC2, together with FMC1 & FMC3 setup various fixed-message configurations.
REC/R/P	24	I	REC: In Address Mode, level-hold (after 1 sec holding) or edge-trigge (toggle on-off), low active, recording from start to end addresses. Debounce & internal pull-up existed. R/P (When Direct Mode is active):
the M			 When R/P is set to Low, level-hold record operation is selected. When R/P is set to High, edge-trigger & toggle on-off playback operation is selected.
XCEK/FMC3	25	- C,	External Clock: In Address Mode, low active and level-hold input. As XCER activated, Rosc pin accepts external clock input signal, provided resistor a Rosc must be removed. Connecting this pin to High enables device running on internal clock via Rosc resistor. If not used, XCEK must be at high level When Direct Mode is active, FMC3, together with FMC1 & FMC2, setup various fixed-message configurations.
FT	26	20	Feed-Through: Low active input, Level-hold, debounce & Internal pull-up required. When FT is selected, the MIC+ input is configured to a single ended input with 1Vp-p maximum input amplitude and feed-through to the

1	1	1	1	480	60.0

Below is an example:

Given sampling rate set to 6.4 kHz, using the ISD1916 to record four messages: three messages of 2.5 seconds and one message of 12.5 seconds, then the memory can be assigned as follows:

	S3, S2, S1, S0	E3, E2, E1, E0
Message 1 (2.5 seconds)	0 0 0 0	0 0 0 1
Message 2 (2.5 seconds)	0 0 1 0	0 0 1 1
Message 3 (2.5 seconds)	0 1 0 0	0 1 0 1
Message 4 (12.5 seconds)	0 1 1 0	1 1 1 1

- Low active input:
 - o level-hold for level-trigger or
 - falling edge for edge-trigger with debounce required.
- For 8kHz sampling frequency, if REC is held at Low for a period equal to 1 sec or more, then level recording is activated. However, if REC is pulsed Low for less than 1 sec, then edge-trigger recording is initiated.
- For 6.4kHz sampling frequency, if REC is held at Low for a period equal to 1.25 sec or more, then level recording is activated. However, if REC is pulsed Low for less than 1.25 sec, then edge-trigger recording is initiated.
- Recording begins from the start address to end address and LED is on.
- · Recording ceases whenever:
 - REC returns to High in level-hold mode or
 - a subsequent low-pulse appears while in edge-trigger mode or
 - when end address is reached.
 - Then an EOM marker is written at the end of message. And LED is off.

nuvoTon

- Then the device will automatically power down.
- This pin has an internal pull-up device.
- Once REC is active, input on FT, Addr/Drct, S0, S1, S2, S3, E0, E1, E2 or E3 is illegal.

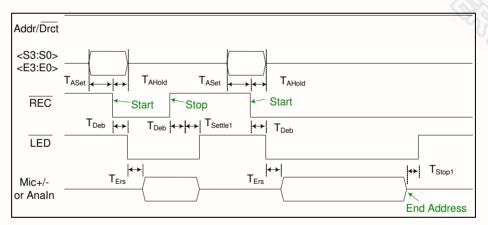

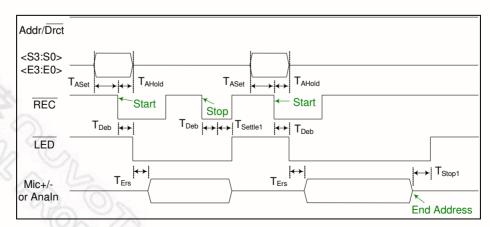

Figure 6-2 Record–Level (REC) function with start and stop actions

nuvoTon

6.1.2 Edge-triggered Playback (PlāyE) Operation

- Low active input, edge-trigger, toggle on-off, debounce required.
- Playback begins from the start address to end address or EOM, whichever occurrs first.
- At the end of message, 1ED pulses Low momentarily.
 - Then device will automatically power down.
- During playback, a subsequent trigger terminates the playback operation. If EOM marker is not encountered, then 1ED will not pulses Low momentarily.
- This pin has an internal pull-up device.
- Once PlāyE is active, input on PlāyE, REC, FT, Addr/Drct, S0, S1, S2, S3, E0, E1, E2 or E3 is banned.

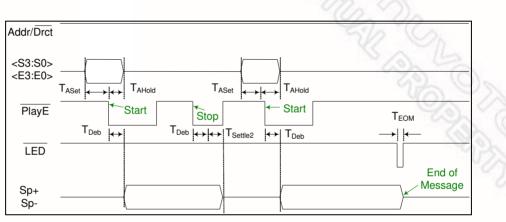

Figure 6-4 Playback–Edge (PlāyE) function

6.1.3 Level-triggered Playback (PlāyL) Operation

- Low active input, Level-hold, debounce required.
- Once active, playback begins from the start address and stops whenever PlayE returns to High. When an EOM is encountered, 1ED pulses Low momentarily.
 - Then device will automatically power down.
- This pin has an internal pull-up device.
- Once PlāyL is active, input on PlāyE, REC, FT, Addr/Drct, S0, S1, S2, S3, E0, E1, E2 or E3 is prohibited.

nuvoTon

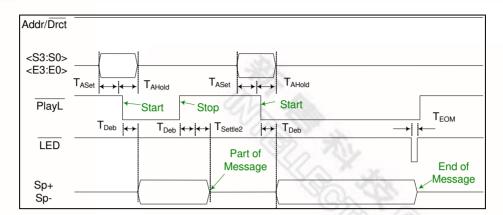

Figure 6-5 Playback-Level (PlāyL) function

• Holding PlāyE Low constantly will perform looping playback function, without power down, from start address to end address.

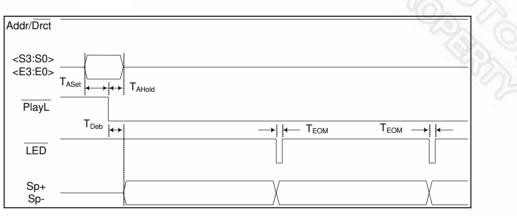

Figure 6-6 Looping playback function via PlāyL

6.1.4 Playback (Supersedes Record) Operation

- Playback takes precedence over the Recording operation.
- If either PlāyE or PlāyE is activated during a recording cycle, the recording immediately ceases with an EOM marker attached, and without power down, playback of the just-recorded message performs accordingly. Then device powers down.

nuvoTon

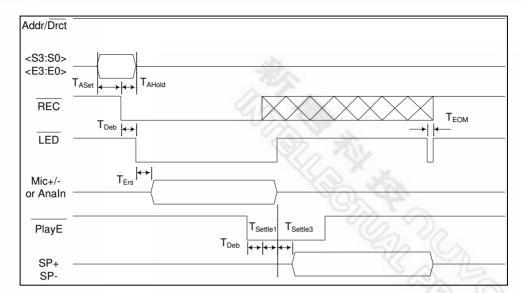

Figure 6-7 An example of Playback supersedes Record

6.1.5 XCLK Feature

- When precision sampling frequency is required, external clock mode can be activated by setting XCEK to Low. Under such condition, the resistor at Rosc pin must be removed and the external clock signal must be applied to the Rosc pin. These conditions must be satisfied prior to any operations.
- However, when internal clock is used, XCEK must be linked to High.
- The external clock frequencies required for various sampling frequencies are listed in below table.

Sampling Freq [kHz]	12	8	6.4	5.3	4
XCEK [MHz]	3.072	2.048	1.638	1.356	1.024

6.2. DIRECT MODE

- The Direct Mode is selected by the Drct pin. Once chosen, the supply voltage must be reset to allow the device to construct itself to the appropriate configuration by re-defining the function on the related control pins. Also, the mode change is only allowed while the device is in power down state and is inhibited when an operation is in progress.
- Once Direct Mode is activated, FMC1, FMC2 & FMC3 are utilized to select various (1 to 8) fixed message configurations ^[1]. Pending upon the arrangement on FMC1, FMC2 & FMC3, each divided message has approximate equal length of duration, which is related to the number of rows assigned as in tables below.
- The record or playback operation is pre-defined by the R/P pin. Setting this pin to Low allows record operation while setting it to High enables playback operation.
- Each message can be randomly accessed via its message control pin (M1 ~ M8) and the desired operations are facilitated accordingly. Non-configured pins are automatically disabled and must be floated.

nuvoTon

nuvoton

Example of four Fixed-Message Configuration:

6.3. OTHER OPERATIONS

6.3.1 Rosc Operation

- When the R_{OSC} varies from 53.3 K Ω to 160 K Ω , the sampling frequency changes from 12 to 4 kHz accordingly.
- When R_{OSC} resistor value is changed during playback, the tone of a recorded message will alter either faster or slower.
- If the ground side of R_{OSC} resistor is floated or tied to V_{CC}, then the current operation will be freezed.
- The operation will resume when the resistor is connected back to ground.

6.3.2 LED Operation

• LED turns on during recording. Also, LED pulses Low at the end of message. The Low period must be sufficiently greater than debounce time.

6.3.3 Feed-Through mode Operation

- As FT is held Low, the Mic+ pin will be reconfigured as Analn input, and the Analn signal will be transmitted to the speaker outputs. Under this mode, Mic- pin is not used (must be floated).
- After FT is enabled, If REC is triggered, then Analn signal will be recorded into memory while the Feed-Through path remains on.
- If FT is already enabled, activating either PlāyĒ or PlāyĒ will first disable the FT path and then play the recorded message. Once playback completes, FT path will be resumed.
- During an operation, activating the FT pin is not allowed.

6.3.4 Power-On Playback Operation

- If PlāyE is kept at Low during power turns on, the device plays message once, then powers down.
- If PlāyE is held at Low during power turns on and constantly maintained at Low, the device will play the message repeatedly, with insignificant dead time between messages regardless of sampling frequencies. This status will sustain unless power is turned off or PlāyE somehow returns to High.

6.3.5 Automatic Single Message Playback

 If LED is connected to PlāyE, once PlāyE is triggered, the device plays message repeatedly without power down between the looping playback. However, if PlāyE is triggered again during playback, then playback will stop.

6.3.6 Power is interrupted Abruptly

• During the device is in operation, it is strongly recommended that the supply power cannot be interrupted. Otherwise, it may cause the device to become malfunctioning.

7. ABSOLUTE MAXIMUM RATINGS ^[1]

ABSOLUTE MAXIMUM RATINGS

CONDITION	VALUE			
Junction temperature	150°C			
Storage temperature range	-65°C to +150°C			
Voltage applied to any pins	$(V_{SS} - 0.3V)$ to $(V_{CC} + 0.3V)$			
Voltage applied to Input pins (current limited to +/-20 mA)	$(V_{SS} - 1.0V)$ to $(V_{CC} + 1.0V)$			
Voltage applied to output pins (current limited to +/-20 mA)	$(V_{SS} - 1.0V)$ to $(V_{CC} + 1.0V)$			
$V_{CC} - V_{SS}$	-0.3V to +7.0V			

^[1] Stresses above those listed may cause permanent damage to the device. Exposure to the absolute maximum ratings may affect device reliability and performance. Functional operation is not implied at these conditions.

7.1. OPERATING CONDITIONS

OPERATING CONDITIONS

CONDITION	VALUE
Operating temperature range	0°C to +50°C
Operating voltage (V _{CC}) ^[1]	+2.4V to +5.5V
Ground voltage (V _{ss}) ^[2]	0V

 $^{[1]}V_{CC}=V_{CCA}=V_{CCD}$

 $^{[2]}V_{SS}=V_{SSA}=V_{SSD}$

8. ELECTRICAL CHARACTERISTICS

8.1. DC PARAMETERS

PARAMETER	SYMBOL	MIN ^[2]	TYP ^[1]	MAX ^[2]	UNITS	COND	ITIONS
Input Low Voltage	V _{IL}			0.3xVcc	V		
Input High Voltage	V _{IH}	0.7xVcc		D.Y.	V		
Output Low Voltage	V _{OL}			0.3xVcc	V	$I_{OL} = 4.0 \text{ m/}$	$\mathcal{A}_{[3]}$
Output High Voltage	V _{OH}	0.7xVcc		XXA	V	I _{OH} = -1.6 m	A ^[3]
Standby Current	I _{STBY}		1	10	μA		
Record Current	I _{REC}		20	30	mA	$V_{CC} = 5.5V$	[4] [5]
Playback Current	I _{PLAY}		20	30	mA	$V_{\rm CC} = 5.5 V,$	no load [4] [5]
Pull-up device for REC, PlāyE, PlāyE, FT & M1 ~ M8 pins	R _{PU1}		600		kΩ	b Co.	
MIC+ Input Resistance	R _{MICP}		18		KΩ	S ~ II	
MIC- Input Resistance	R _{MICN}		18		KΩ	62	6
Analn Input Resistance	R _{ANAIN}		42		KΩ	Ser	(0)
MIC Differential Input	V _{IN1}	15		300	mV	Peak-to-peak	
Analn Input	V _{IN2}			1	V	Peak-to-peak	
Gain from MIC to SP+/-	A _{MSP}	6		40	dB	$V_{IN} = 15 \sim 300 \text{ mVp-p},$ AGC = 4.7 μ F, $V_{CC} = 2.4 V \sim 5.5 V$	
Gain from AnaIn to SP+/-	A _{ASP}		0		dB	$V_{CC} = 2.4 V \sim 3$	
Output Load Impedance	R _{SPK}	8			Ω	Speaker loa	ad
Speaker Output Power	Pout		670		mW	$V_{DD} = 5.5 V$	/
			313		mW	$V_{DD} = 4.4 V$	1 kHz sine
			117		mW	V _{DD} = 3 V	wave at Analn. R _{SPK}
			49		mW	V _{DD} = 2.4 V	= 8 Ω
Speaker Output Voltage	V _{OUT1}		V_{DD}		V	R_{SPK} = 8 Ω Speaker, Typical buzzer	
Total Harmonic Distortion	THD		1		%	15 mV p-p 1 kHz sine wave, Cmessage weighted	

Notes: [1] Typical values @ V_{CC} = 5.5V, T_A = 25° and sampling frequency (Fs) at 8 kHz, unless stated.

[2] Not all specifications are 100 percent tested. All Min/Max limits are guaranteed by Nuvoton via design, electrical testing and/or characterization.

[3]

[5] All required control pins must be at appropriate status. External components are biased under a separated power supply.

8.2. AC PARAMETERS

CHARACTERISTIC ^[1]	SYMBOL	MIN ^[2]	TYP	MAX ^[2]	UNITS	CONDITIONS
Sampling Frequency	Fs	4	1	12	kHz	[3]
Record / Playback Duration (ISD1916)	T _{REC} / T _{PLAY}	10.6	27	32	sec	[3]
Record / Playback Duration (ISD1932)	T _{REC} / T _{PLAY}	21.3	With	64	sec	[3]
Record / Playback Duration (ISD1964)	T _{REC} / T _{PLAY}	42.6	R	128	sec	[3]
Debounce Time	T _{Deb}	225k/Fs		V.O.	msec	[3] [4]
Address Setup Time	T _{ASet}	30		Ya	nsec	5
Address Hold Time	T _{Ahold}	225k/Fs		9	msec	[3] [4]
Erase Time	T _{Ers}	1.25MRN			msec	MRN = message row #
FMC Setup Time	T _{Fset}	30			nsec	Y Ca
Record Settle Time	T _{Settle1}		32k/Fs		msec	[3] [4]
Play Settle Time	T _{Settle2}		256k/Fs		msec	[3] [4]
Delay from Record to Play	T _{Settle3}		128k/Fs		msec	[3] [4]
Record Stop Time	T _{Stop1}	30			nsec	
LED Pulse Low Time	T _{EOM}		256k/Fs		msec	[3] [4]

Notes:

[1] Conditions are $V_{CC} = 5.5V$, $T_A = 25^{\circ}C$ and sampling frequency (F_S) at 8kHz, unless specified.

[2] Not all specifications are 100 percent tested. All Min/Max limits are guaranteed by Nuvoton via design, electrical testing and/or characterization.

[3] When different Fs is applied, the value will change accordingly. Also, stability of internal oscillator may vary as much as $\pm 10\%$ over the operating temperature and voltage ranges. [4]

k = 1000.

9. TYPICAL APPLICATION CIRCUIT

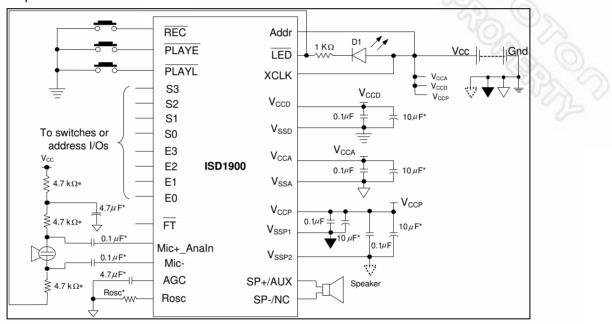

The following typical application examples on ISD1900 series are for references only. They make no representation or warranty that such applications shall be suitable for the use specified. It's customer's obligation to verify the design in its own system for the functionalities, voice quality, current consumption, and etc.

In addition, the below notes apply to the following application examples:

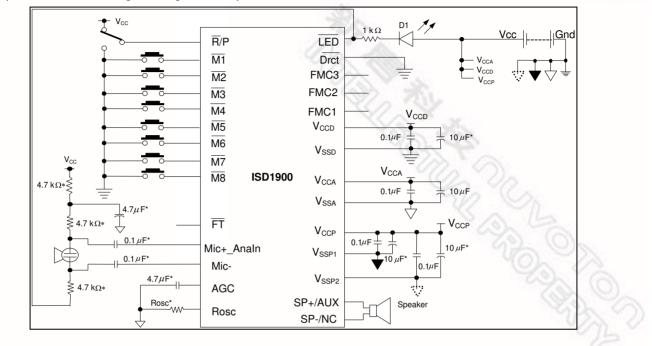

• The suggested values are for references only. Depending on system requirements, they can be adjusted for functionalities, voice quality and degree of performance.

It is important to have a separate path for each ground and power back to the related terminals to minimize the noise. Besides, the power supplies should be decoupled as close to the device as possible.

Also, it is crucial to follow good audio design practices in layout and power supply decoupling. See recommendations in Application Notes from our websites.

Example #1: Operations via start and end address under Address Mode.

Example #2: Fixed Message Configuration Operations under Direct Mode.

NUVOTON

Good Audio Design Practices

Nuvoton's ChipCorder are very high-quality single-chip voice recording and playback devices. To ensure the highest quality voice reproduction, it is important that good audio design practices on layout and power supply decoupling are followed. See Application Information links below for details.

Good Audio Design Practices
