

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

IX9908 Triac-Dimmable Evaluation Board User's Guide

1. Introduction

IXYS Integrated Circuits Division's IX9908 Evaluation Board contains all the necessary circuitry to demonstrate the features of the IX9908 single-stage flyback controller in a triac dimmable, high power factor LED driver. The IX9908 IC architecture includes quasi-resonant primary control with an integrated high voltage startup cell. This evaluation board features high power factor, high efficiency and outstanding dimming performance.

1.1 Features:

- TRIAC dimmer compatible, no output flicker or pop-on
- Fast startup
- High efficiency >85%
- Low cost, low component count
- Open string protection
- High power factor > 0.9
- Digital soft-start
- Cycle-by-cycle peak current control

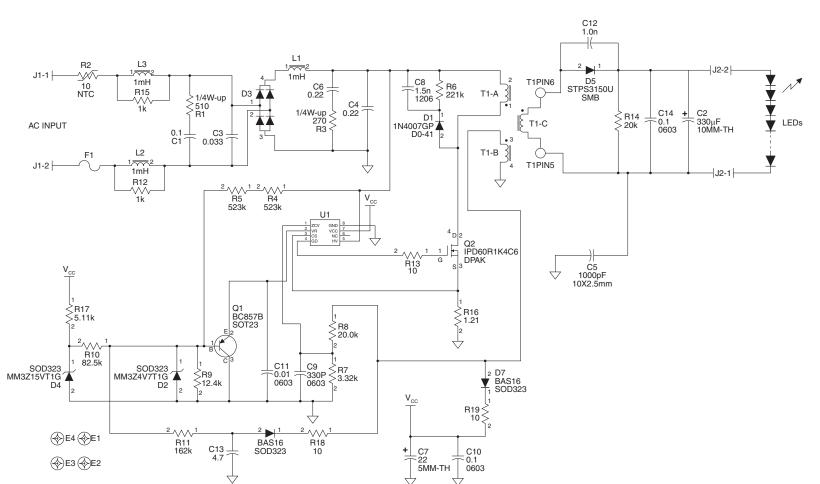

Figure 1. IX9908 Evaluation Board, Top View

2. Power Supply Specifications

Parameter	Symbol	Range	Units
Input Voltage	V_{IN}	90-135	V_{AC}
Input Frequency	f-line	60	Hz
Output Voltage	V _{out}	19-26	V
Output Current	l _{out}	450-600	mA
Efficiency	-	85-86	%
Power Factor	-	0.92 min	-

Figure 2. IX9908 Evaluation Board Schematic

3. Circuit Description

The IX9908 is configured to drive an external MOSFET in a quasi-resonant flyback converter power stage providing a constant current output to a LED string while maintaining high power factor.

3.1 Input Filtering:

Fuse F1 provides input overcurrent protection. Diode bridge D3 rectifies the AC line and C4 provides decoupling for the input to the buck converter. L1, L2, L3, C3 and C4 form a 2 stage conducted EMI filter. R12 and R15 provide damping for any resonances between the input inductors, capacitors and the AC line impedance.

Damping networks R1-C1 and R3-C6 provide damping of the filter when the circuit is connected to a TRIAC based dimmer. Otherwise the high dv/dt when the TRIAC turns on would create large oscillations in the line current that would commutate the TRIAC before the next zero crossing of the AC line cycle.

3.2 Power Stage:

Q2, T1, D5 and C2 form a flyback converter power stage. The IX9908 drives the gate of MOSFET Q2. Current is sensed with R16 and the signal fed back into the IX9908. The IX9908 provide leading edge blanking of the current signal, eliminating the need for an external R-C filter.

The AC input voltage is sensed through R4, R5 and R9 and applied to the base of transistor Q1, the emitter of which is connected to the VR pin of the IX9908. The peak current in the primary winding is approximately proportional to the voltage on the VR pin of the IX9908. This causes the input line current to be shaped in a sinusoidal fashion and therefore high power factor is achieved.

Line regulation is achieved by the circuitry formed by R18, D6, C13 and R11, as well as the internal foldback correction function of the IX9908. D6 and C13 rectify the bias winding of transformer T1 to produce a negative voltage proportional to the rectified input voltage. This negative voltage is summed into the voltage on the base of Q1 through R11. This stabilizes the voltage at the VR against variations in line voltage. In order to prevent the voltage on VR from going too low, R10, R17 and D4 add a DC offset to the base of Q1.

The internal foldback correction circuit senses the input voltage through R8 and the bias winding of the transformer T1. This means that the primary winding current will decrease as the input voltage increases. The amount of the reduction in primary current is adjusted by varying R8.

3.3 Performance Data

Number of LEDs in Output String	LED String Current	LED String Voltage	LED String Power	Input Power Factor	Efficiency
6	0.568	19.34	11.0	0.948	85.3
7	0.528	22.385	11.8	0.953	85.7
8	0.49	25.35	12.42	0.957	85.9

5. Operating Waveforms

5.1 Output Current with 6 LED string 200mA/DIV

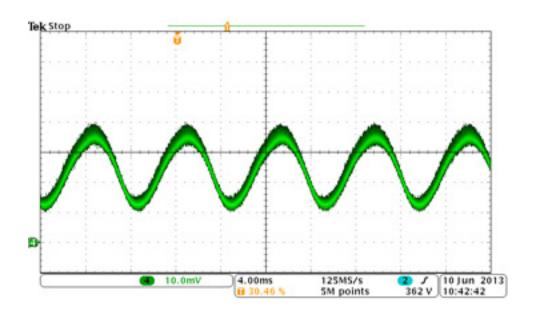

5.2 Drain to source voltage - 6 LEDs

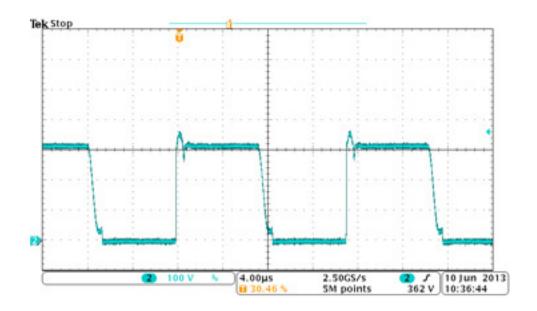

5.3 Output Current with 7 LED string 200mA/DIV

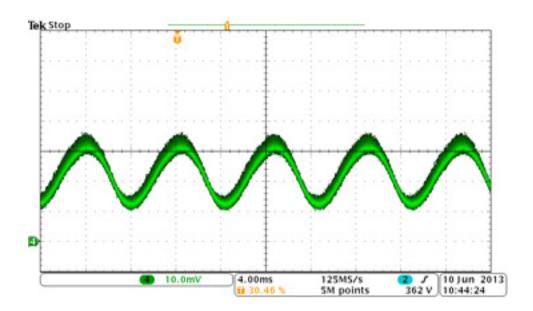

5.4 Drain to source voltage - 7 LEDs

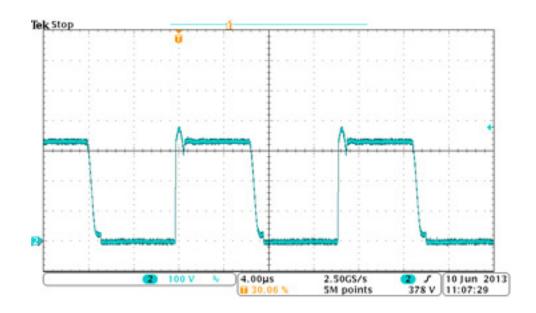

5.5 Output Current with 8 LED string, 200mA/DIV

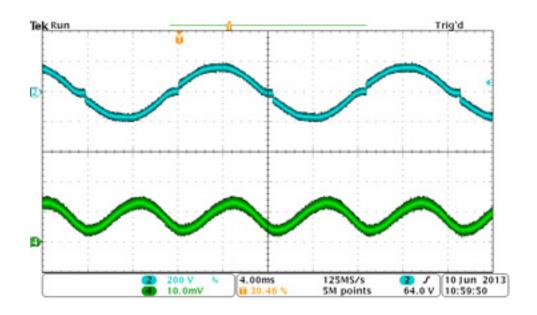

5.6 Drain to source voltage - 8 LEDs

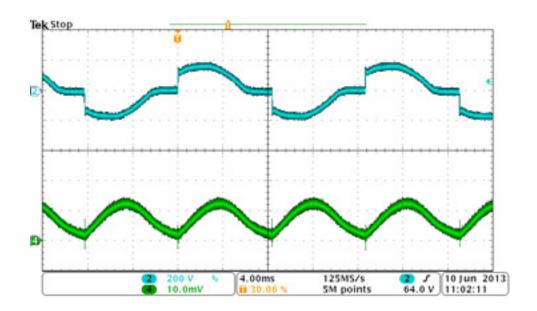

5.7 Dimming Waveforms using 7 LED string

5.7.1 Dimmer full on, upper trace= line voltage, lower trace = LED current 500mA/DIV.

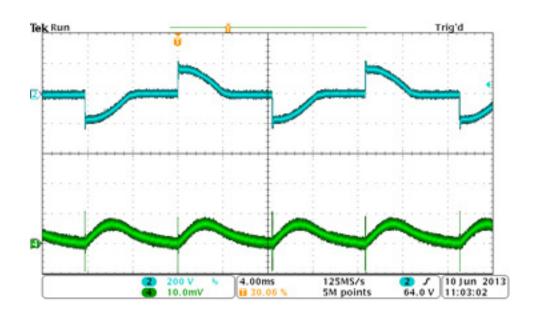

5.7.2 Dimmer on for 6 msec, upper trace= line voltage, lower trace = LED current 500mA/DIV.

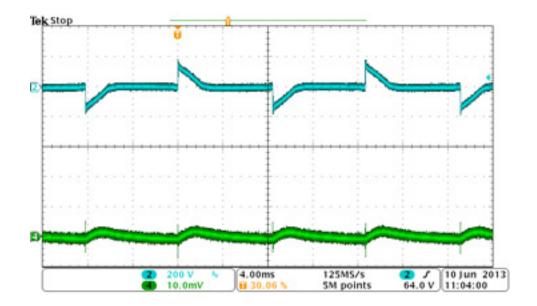

8 www.ixysic.com R01

5.7.3 Dimmer on for 4 msec, upper trace= line voltage, lower trace = LED current 500mA/DIV

5.7.4 Dimmer on for 2 msec, upper trace= line voltage, lower trace = LED current 500mA/DIV
