

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## **QUAD DARLINGTON SWITCH**

- FOUR NON INVERTING INPUTS WITH ENABLE
- OUTPUT VOLTAGE UP TO 60 V
- OUTPUT CURRENT UP TO 1.8 A
- VERY LOW SATURATION VOLTAGE
- TTL COMPATIBLE INPUTS
- INTEGRAL FAST RECIRCULATION DIODES

#### **DESCRIPTION**

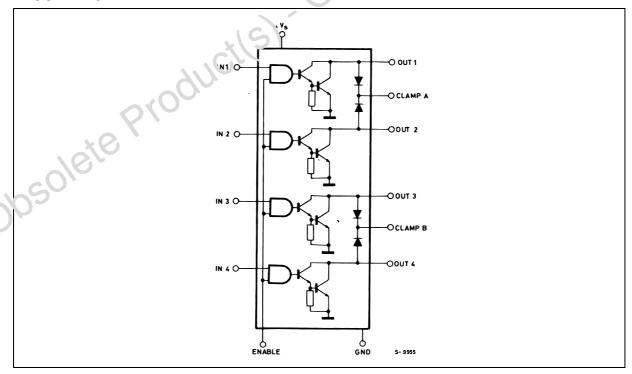

The L6221 monolithic quad darlington switch is designed for high current, high voltage switching applications. Each of the four switches is controlled by a logic input and all four are controlled by a common enable input. All inputs are TTL-compatible for direct connection to logic circuits.

Each switch consists of an open-collector darlington transistor plus a fast diode for switching applications with inductive device loads. The emitters of the four-switches are commoned. Any number of inputs and

outputs of the same device may be paralleled. Three versions are available: the L6221C mounted in a Power lip 12 + 2 + 2 package and the L6221CN mounted in a 15--lead Multiwatt package, the L6221CD in SO16+2+2 package.

Figure 18.

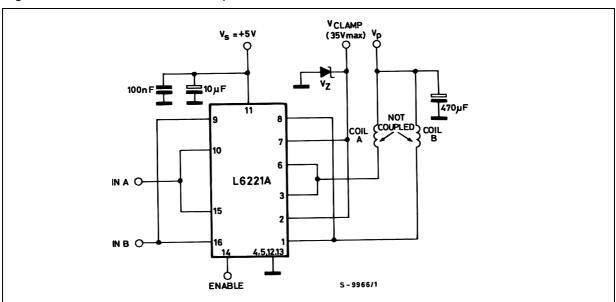

### **APPLICATION INFORMATION**

When inductive loads are driven by L6221C/CD, a zener diode in series with the integral free-wheeling diodes increases the voltage across which energy stored in the load is discharged and therefore speeds the current decay (fig. 18).

The zener has to be chosen in such a way that  $V_{\text{CLAMP}}$  is limited to 60V taking into account the zener's voltage changes due to: spread on  $V_Z$ , temperature changes, and the voltage drop due to ohmic resistance.

Moreover, the instantaneous power must be limited in order to avoid the reverse second breakdown.

Figure 19: Driver for Solenoids up to 3A.

Some care must be taken to ensure that the collectors are placed close together to avoid different current partitioning at turn-off.

We suggest to put in parallel channel 1 and 4 and channel 2 and 3 as shown in figure 19 for the similar

electrical characteristics of the logic section (turn-on and turn-off delay time) and the power stages (collector saturation voltage, free-wheeling diode forward voltage).

Duty Cycle for 1 or 2 Paralleled
Outputs Driven (L6221N).

### **MOUNTING INSTRUCTION**

The  $R_{th j-amb}$  of the L6221C can be reduced by soldering the GND pins to a suitable copper area of the printed circuit board (Fig. 23) or to an external heatsink (Fig. 24).

The diagram of figure 25 shows the maximum dissipable power  $P_{tot}$  and the  $R_{th\ j\text{-}amb}$  as a function of the side "  $\alpha$ " of two equal square copper areas hav-

Figure 23: Example of P.C. Board Copper Area Which is Used as Heatsink.

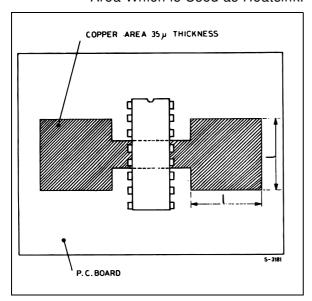

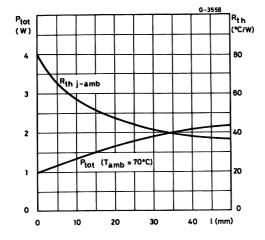

Figure 25: Maximum Dissipable Power and Junction to Ambient Thermal Resistance vs. Side " α".

ing a thickness of  $35\mu$  (1.4 mils). During soldering the pins temperature must not exceed 260  $^{\circ}C$  and the soldering time must not be longer than 12 seconds.

The external heatsink or printed circuit copper area must be connected to electrical ground.

Figure 24 : External Heatsink Mounting Example.

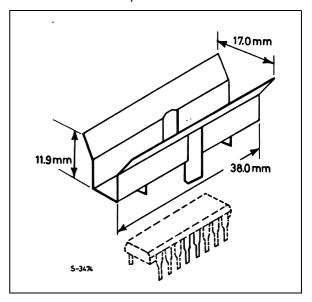

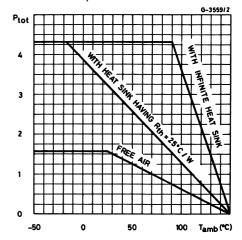

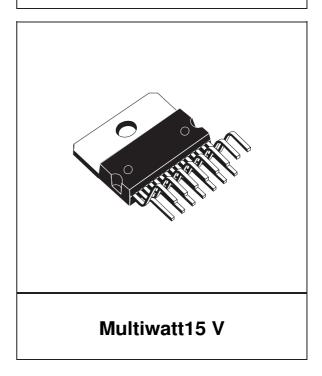

Figure 26: Maximum Allowable Power
Dissipation vs. Ambient
Temperature.
