

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Multifunction IC for engine management system

Datasheet - production data

Features

- 5 V logic regulator
- 3.3 V logic regulator
- 5 V tracking sensor supply
- Smart reset function
- Power latch with Secure Engine Off (SEO) functionality, to safely complete driver switch off procedure
- Flying wheel interface function (VRS) with adaptive time and amplitude control
- Protected low-side relay driver
 - OUT13 to 18, MRD
- Protected low-side (injector drivers)
 - OUT1 to 4
- Protected low-side (high current)
 - OUT5, 6, 7
- Protected low-side (low current)
 - OUT20
- IGBT pre-drivers (IGN1 to 4) with parallel input
- Parallel input IN1 to IN7 to drive OUT1 to OUT7
- Configurable power stages CPS
 - Stepper motor driver/ high-side - low-side (OUTA to D)
- Thermal warning and shutdown
- Serial interface
 - SPI 16-bit frame
 - ISO9141 interface (K-Line)
- High speed CAN transceiver
- VDA 2.0 compliance with 3 level Watchdog
- Package: HiQUAD-64

Description

The L9779WD-SPI is an integrated circuit designed for automotive environment and implemented in BCD6S technology.

It is conceived to provide all basic functions for standard engine management control units.

It is assembled in the HiQUAD-64 power package.

Table 1. Device summary

Order code	Package	Packing
L9779WD-SPI	HiQUAD-64	Tray
L9779WD-SPI-TR	HiQUAD-64	Tape and Reel

1 Detailed features description

- Package
 - HiQUAD-64
- 5 V logic regulator
 - 5 V precision voltage regulator ($\pm 2\%$) with external NMOS
 - Max current regulated: 400 mA
 - Charge pump capacitor at pin CP is used to drive the gate of the external NMOS transistor
- 3.3 V logic regulator
 - 3.3 V precision voltage regulator ($\pm 2\%$) with over-current protection
 - Max current regulated: 100 mA
- 5 V tracking sensor supply
 - 2 x 5 V tracking sensor supply with protection and diagnosis on SPI
 - Short-circuit to Vbat/GND fully protected
 - Max current regulated: 2 x 100 mA
- Smart reset
 - Main Reset monitoring VB_UV Logic voltage management and safety control
- Watch dog
 - Main reset management 5 V voltage monitoring safety output disable
 - SPI controllable query and answer watch dog compliant with VDA2.0 level 3 (enabled by default)
- Power latch
 - L9779WD-SPI is switched on by KEY_ON signal and switched off by logic OR of KEY_ON signal and SPI bit
- Secure engine off mode (default) switches off the drivers in the following order:
 - OUT1 through to OUT4 in 225 ms (typical)
 - OUT13 and OUT14 in 600 ms (typical)
- Flying wheel interface function (VRS)
 - The VRS is the interface between the microprocessor and the magnetic pick-up or variable reluctance sensor that collects the information coming from the flying wheel
 - Adaptive filtering on amplitude and timing adapts better the device response to VRS input switching
- Protected low-side driver
 - LSa (OUT1 to 5)
 - 4 Ch. serial IN via SPI and parallel IN, $R_{dson} = 0.72 \text{ Ohm @}150^\circ\text{C}$, $V_{cl} = 58 \text{ V } \pm 5$, $I_{max} = 2.2 \text{ A}$;
 - 1 Ch. serial IN via SPI and parallel IN, $R_{dson} = 0.72 \text{ Ohm @}150^\circ\text{C}$, $V_{cl} = 58 \text{ V } \pm 5$, $I_{max} = 3 \text{ A}$;
 - LSb (OUT6, 7)
 - 2 Ch. serial IN via SPI and parallel IN, $R_{dson} = 0.47 \text{ Ohm @}150^\circ\text{C}$, $V_{cl} = 45 \text{ V } \pm 5$, $I_{max} = 5 \text{ A}$

Full diagnosis on SPI (2 bit for each channel) and voltage slew rate control.

When an over current fault occurs, the driver switches off with faster slew rate in order to reduce the power dissipation.

- LSc (OUT20)
 - 1 Ch serial IN via SPI, $I_{max} = 50 \text{ mA}$

- LSD (OUT13 to 18, MRD)

6 Ch. serial IN via SPI, $R_{dson} = 1.5 \text{ Ohm @ } 150 \text{ }^\circ\text{C}$, $V_{cl} = 48 \text{ V}$, $I_{max} = 600 \text{ mA}$ (2 of them with low battery voltage function);

1 main relay driver $R_{dson} = 2.4 \text{ Ohm @ } 150 \text{ }^\circ\text{C}$, $V_{cl} = 48 \text{ V}$, $I_{max} = 600 \text{ mA}$

With full diagnosis on SPI (2 bit for each channel) and voltage slew-rate control.

When an over current fault occurs, the driver switches off with faster slew rate in order to reduce the power dissipation.

- Ignition pre-drivers (IGN1 to 4) with parallel input
 - 4 x ignition pre-drivers with full diagnostic.
- SPI
- 1 x Stepper motor driver designed for a double winding coil motor, used for engine idle speed control.

The stepper driver is made by 4 independent half bridgeS each one with:

- 1 high-side driver, $R_{dson} = 1.5 \text{ Ohm}$, $I_{max} = 600 \text{ mA}$
- 1 low-side driver, $R_{dson} = 1.5 \text{ Ohm}$, $I_{max} = 600 \text{ mA}$

The low-side drivers could be connected in parallel.

Low-side and high-side drivers implement voltage SR control to minimize emission.

Two high-side drivers have the low battery voltage function.

- Thermal shutdown
 - 1 x Thermal shutdown ($T_j > 175 \text{ }^\circ\text{C} = T_{sd}$) if $T_j > T_{sd}$: VTRK1, 2 are turned off.
 - 1 x Thermal shutdown ($T_j > 175 \text{ }^\circ\text{C} = T_{sd}$) if $T_j > T_{sd}$: OUT1 to 10, OUT13 to 20, OUTA to D, IGN1 to 4 are turned off.
 - 1 x Thermal Shutdown ($T_j > 175 \text{ }^\circ\text{C} = T_{sd}$) if $T_j > T_{sd}$: V3V3 is turned off.
 - 1 x Thermal shutdown ($T_j > 175 \text{ }^\circ\text{C} = T_{sd}$) if $T_j > T_{sd}$: MRD is turned off (if battery present).

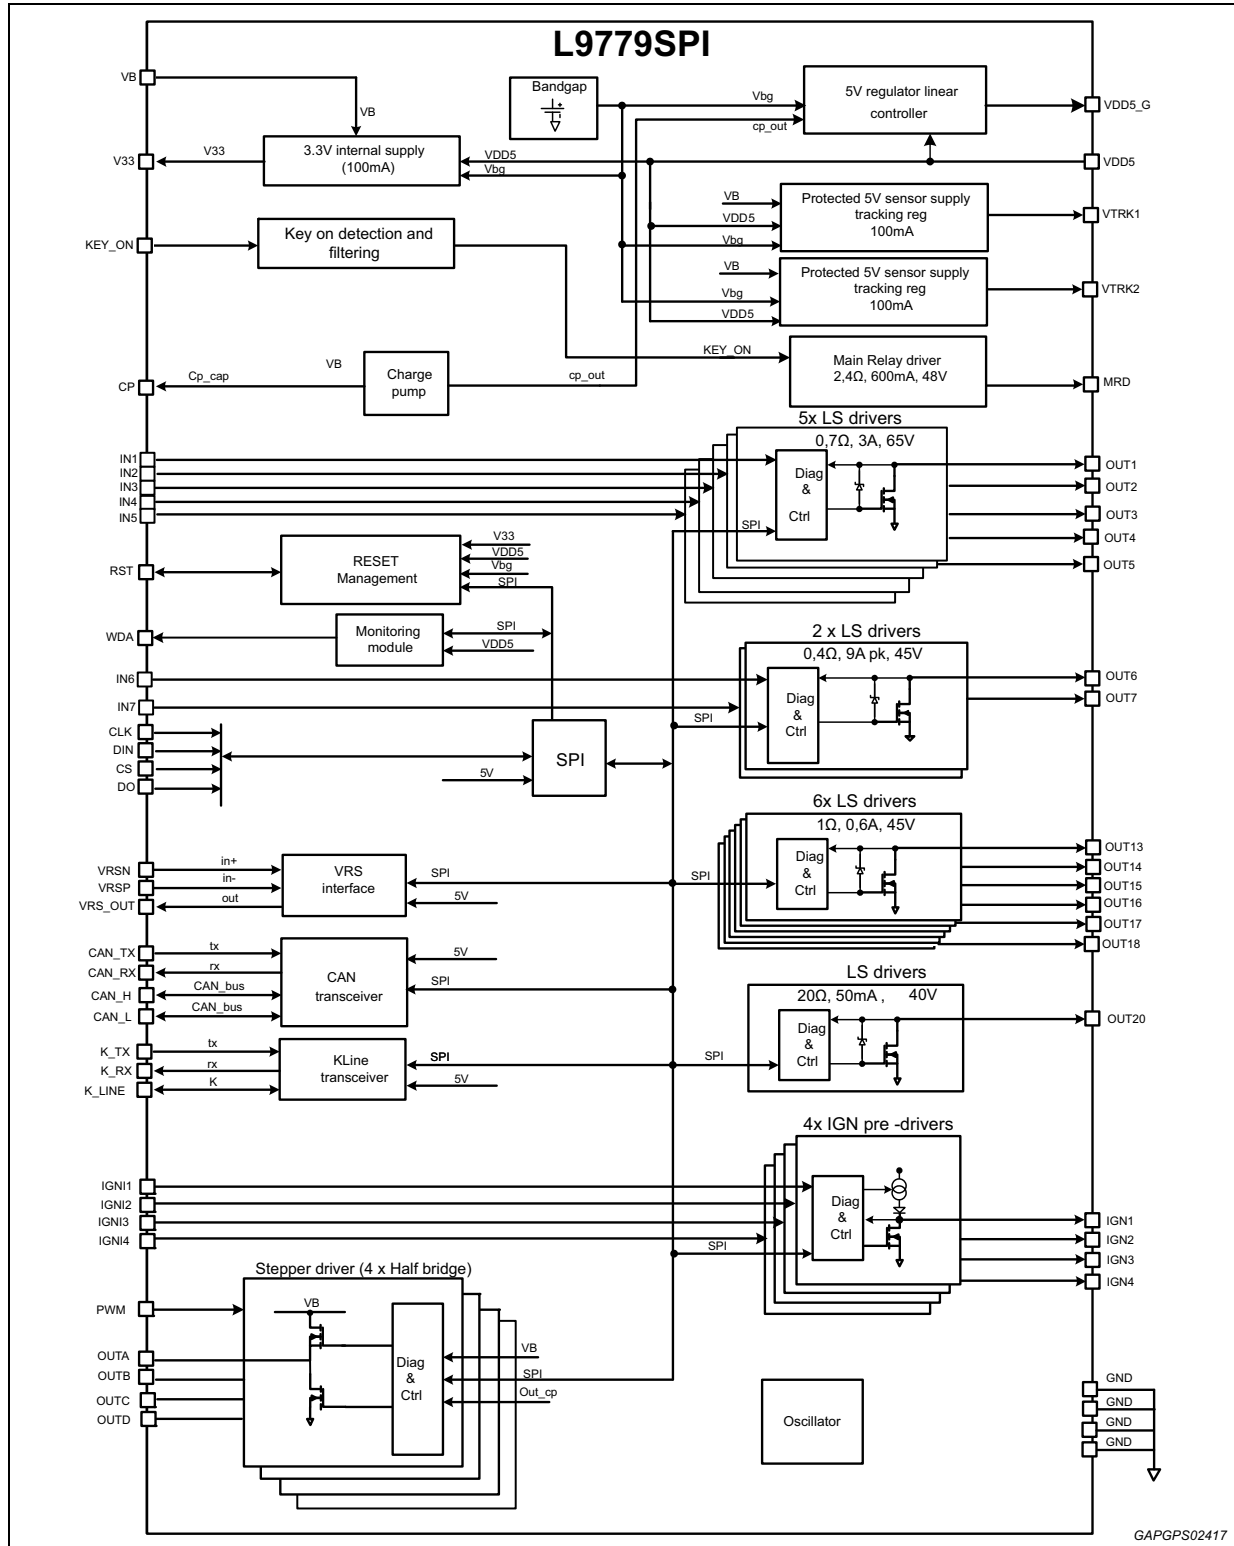

There are 5 temperature sensors for OT2 (OUT1..10, OUT13...20, OUT21...28, IGN1...4 are turned off) in different Layout position, they are logically "AND" in case of thermal shutdown.

- ISO9141 interface
 - ISO9141 serial interface (K-Line)
- CAN transceiver

The CAN bus transceiver allows the connection of the microcontroller, with CAN controller unit, to a high speed CAN bus with transmission rates up to 1Mbit/s for exchange of data with other ECUs.

21	GND	Stepper GND	GND	-

1. External components required.

Note: OUT11 and OUT12 are not valid.

4 Application schematic

Figure 3. Application schematic

5 Absolute maximum ratings

Warning: Maximum ratings are absolute ratings: exceeding any of these values may cause permanent damage to the integrated circuit

Table 3. Absolute maximum ratings

Pin	Parameter	Condition	Value	Unit
VB	DC supply battery power voltage (Vb)	Also without external components	-0.3 to +40	V
V3V3	DC logic supply voltage	-	-0.3 to VDD5, when V3V3 = VDD5 = 19 V max	V
VTRK1,2	DC sensors supply voltage	-	-2 to +40	V
VDD_G	-	-	-0.3 to VDD5, when VDDG = VDD5 = 19 V max	V
VDD5	Voltage pin	-	-0.3 to 19	V
CP	-	-	-0.3 to 40 Max ABS = +40 V when VB = 40 V	V
KEY_ON	-	Protected with external component (R = 1 k Ω plus a diode, refer to Figure 4) for negative pulse (isopulse 1)	-1.2 to +40	V
RST	-	-	-0.3 to +19	V
VRSP	-	Max current to be limited with external resistors (see Section 6.14.3: Application circuits on page 93)	-20 to +20	mA
VRSM	-	Max current to be limited with external resistors (see Section 6.14.3: Application circuits on page 93)	-20 to +20	mA

5.1 ESD protection

Table 4. ESD protection

Item	Condition	Min	Max	Unit
All pins	Electro static discharge voltage “Charged-device-model – CDM” all pin ⁽¹⁾	-500	+500	V
All pins	Electro static discharge voltage “Charged-device-model – CDM” corner pin (1,20,21,32,33,52,53,64)	-750	+750	V
All pins	ESD voltage HBM respect to GND	-2	+2	KV
Pins to connector ⁽²⁾	ESD voltage HBM respect to GND	-4	+4	KV

1. Except OUTA, B, C, D ±250 V.

2. Pins are LSa, LSb, LSc, LSd, IGNx, VTRK1-2, CAN_H, CAN_L, K_LINE, OUTA, B, C, D.

Test circuit according to HBM (EIA/JESD22-A114-B) and CDM (EIA/JESD22-C101-C).

5.2 Latch-up test

According to JEDEC 78 class 2 level A.

5.3 Temperature ranges and thermal data

Table 5. Temperature ranges and thermal data

Symbol	Parameter	Min	Max	Unit
T_{amb}	Operating temperature	-40	125	°C
T_j	Continuative operative junction temperature	-40	150	°C
T_{stg}	Storage temperature	-40	150	°C
$R_{thj-case}$	Thermal resistance junction-to-case	-	1	°C/W
$R_{thj-amb}$	Thermal resistance junction-to-ambient ⁽¹⁾	-	16	°C/W
T_s	Lead temperature during soldering (for a time = 10 s max)	-	260	°C

1. With 2S2P+vias PCB.

5.4 Operating range

Table 6. Operating range

Pins symbol	Battery voltage range	Junction temperature condition	Note
VB	$4.15\text{ V} < V_b < 6\text{ V}$	$-40 < T_j < 40$	Low battery
	$6\text{ V} < V_b = 18\text{ V}$	$-40 < T_j < 150$	Normal battery
	$18\text{ V} < V_b = 28\text{ V}$	$-40 < T_j < 40$	High battery
	$28 < V_b = 40\text{ V}$, $t_{rise} = 10\text{ms}$, $T_{pulse} = 400\text{ ms}$.	$-40 < T_j < 40$	Load dump

5.4.1 Low battery

All the functions are guaranteed with degraded parameters. The voltage regulators follow VB in RDSon mode with drop-out depending on load current. V3V3 regulator works as expected assuming $V_{DD5} > 4\text{ V}$.

5.4.2 Normal battery

All the functions and the parameters are guaranteed by testing coverage.

5.4.3 High battery

All the functions are guaranteed with degraded parameters.

5.4.4 Load dump

The device is switched-off if load dump exceeds battery overvoltage threshold for a time longer than filter time.

6 Functional description

6.1 Ignition switch, main relay, battery pin

The system has an ignition switch pin KEY_ON and a pin VB for battery behind the main relay connected at pin MRD.

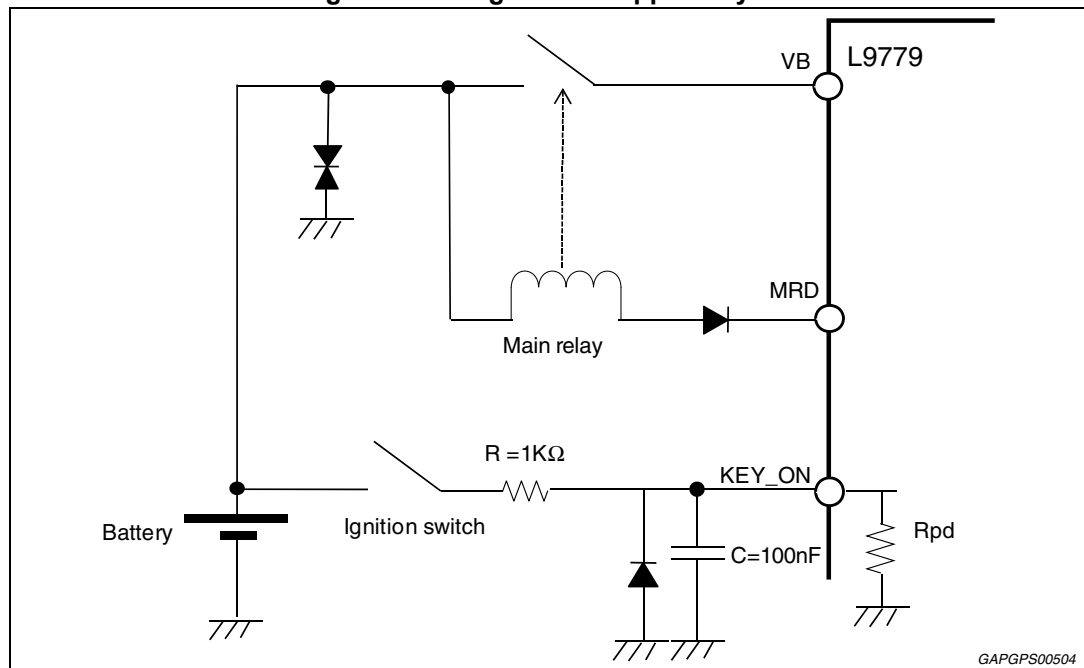

L9779WD-SPI can also support the configuration where it is permanently supplied by VB; in this case the MRD output can be used to connect the loads to VB.

At pin KEY_ON there is an external diode for reverse battery protection. An internal Pull-down resistor is provided on the KEY_ON pin. The external components to be connected to KEY pin are shown in the below schematic.

Internal functions and regulators are supplied by VB; only some basic functions required for startup are supplied from KEY_ON as described below. Reverse protection for pin VB is done by the main relay. Transient negative voltage at VB may be limited by an external diode if necessary. There is no integrated reverse protection at pin VB.

The pin connected to the battery line can bear the ISO 7637/1 noise pulses without any damage. The VB voltage must be externally limited to +40 V and -0.3 V (with external components as in [Figure 4](#)). It is suggested the use of a transil.

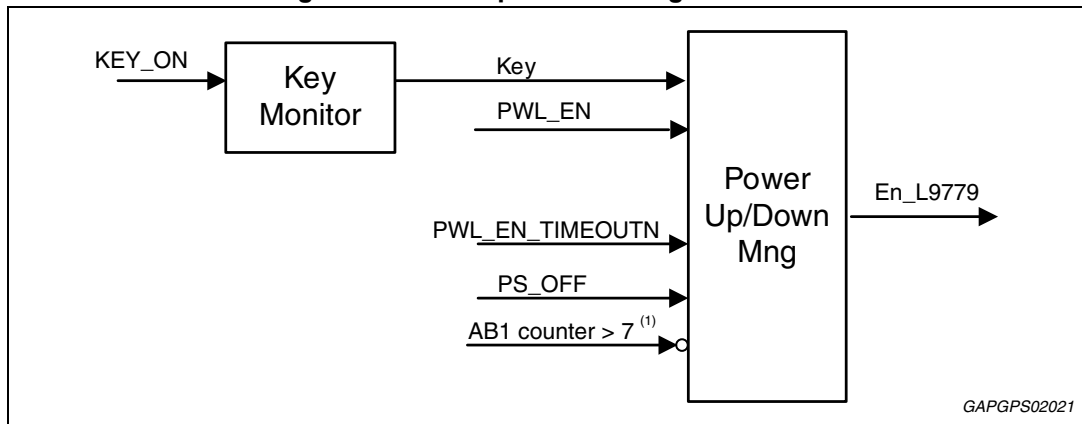

Figure 4. Configuration supplied by VB

1. The external components connected to KEY_ON pin are mandatory in order to protect the device from ISO 7637 pulses.

6.2 Power-up/down management unit

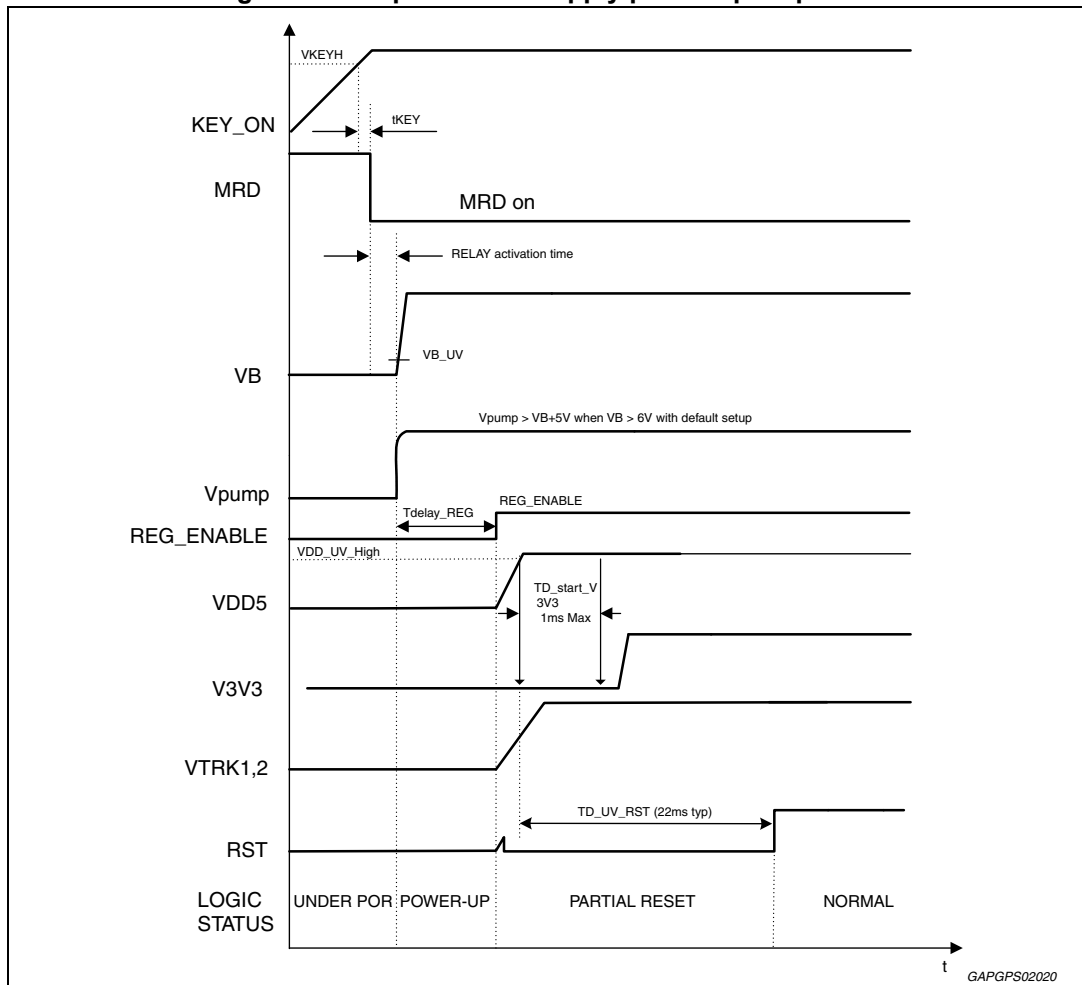

Figure 5. Power-up/down management unit

1. AB1 counter function defined at WDA [Section 6.15.1](#).

6.2.1 Power-up sequence

Figure 6. Non-permanent supply power-up sequence

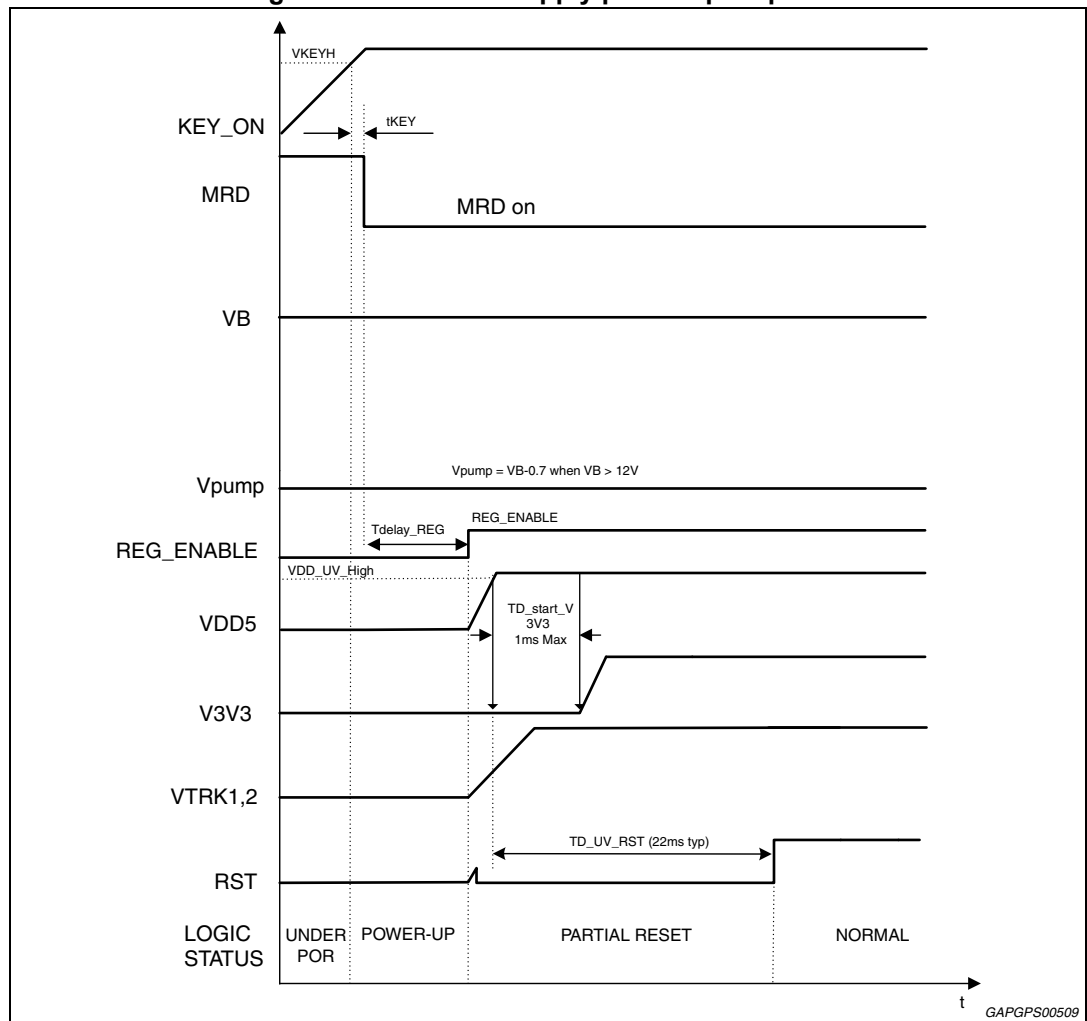

When the KEY_ON reaches a sufficient high voltage VKEYH, after a minimum deglitch filter time T_KEY the system is switched on. First of all the main relay driver is switched on, so the main relay connects VB pin to battery.

Control current into pin KEY_ON is sufficient for basic functions such as filtering time, control of the main relay output stage, internal oscillator and internal bias currents.

When the voltage at VB exceeds the under voltage-detection threshold for VB (VB_UV_H) the internal biasing circuits are activated.

VDD5 regulator is activated Tdelay_REG seconds later. After VDD5 exceeds the VDD_UV threshold and with typ. 1.0 ms delay, the V3V3 is activated also. The sensor supplies VTRK1, 2 are turned on together with VDD5.

Figure 7. Permanent supply power-up sequence

In the case when VB is always connected, when the KEY_ON voltage exceeds VKEYH the internal biasing circuits are activated.

VDD5 regulator is activated Tdelay_REG seconds after the tKEY filter time has expired.

VDD5 regulator is activated Tdelay_REG seconds later. After VDD5 exceeds the VDD_UV threshold and with typ. 1.0 ms delay, the V3V3 has activated also. The sensor supplies VTRK1, 2 are turned on together with VDD5.

6.2.2 Power-down sequence

The system is switched off according to the status of KEY_ON, VB and power latch mode bit PWL_EN_N set by the μ C, according to:

$$\text{En_L9779} = [(\text{!PWL_EN_N AND PWL_EN_TIMEOUTN}) \text{ OR KEY_ON}] \text{ AND VB_UVN.}$$

The KEY_ON is the status of KEY_ON pin after deglitch filter time.

En_L9779 represents the enable signals used by different blocks.

The system will be switched off after a minimum deglitch filter time if the voltage at pin KEY_ON is below VKEYL and if power latch mode is not active i.e. PWL_EN_N=1.

Otherwise, if the power latch mode is active PWL_EN_N=0, nothing happens until the power latch mode has finished by the μ C writing PWL_EN_N=1.

However L9779WD-SPI will wait for a maximum time-out time PWL_TIMEOUT for PWL_EN_N de-assertion after which the system will be forced to switch off.

PWL_TIMEOUT can be enabled and configured by 3 bit PWL_TIMEOUT_CONF.

For TNL description see Smart reset circuit description.

The status of KEY_ON can be read through the bit KEY_ON_STATUS. After tKEY filter time the status of KEY_ON can be read through the bit KEY_ON_FLT also.

All the supply outputs shall be switched-off simultaneously. If the supplied devices have particular sequencing requirements, external diodes or clamping devices will be used.

During power down, whether the regulators are switched off at the same time as the main relay output or not is decided via the <PSOFF> bit.

- <PSOFF>='0' (default): simultaneous switching-off the regulators with the main-relay driver MRD
- <PSOFF>='1': regulators remain active when the main relay driver MRD will be switched off

With this function it is possible to detect a stuck main relay. If conditions to switch off are satisfied when <PSOFF>='1', the MRD is switched off while the voltage regulators continue to operate as long as no under voltage is detected at VB. The RST pin is not asserted till VDD_UV. The μ C measures the time passed since shutdown. If a certain time is exceeded, then a stuck main relay is detected and this fault is stored in the μ C (not in the L9779WD-SPI). After this the μ C turns off the voltage regulators by setting the bit <PSOFF> to '0' (reset state). With a stuck main relay the voltage at pin VB remains present at battery level with a current consumption of I_{Leak} .

Secure Engine Off function is that the engine can be directly switched off by the key-switch via a hardware path and without the help or interference of software or μ C.

Whenever the KEY_ON signal goes low the output stages mentioned in the following pages are disabled, no matter what other conditions (like e.g. "power-latch") are.

In no power latch/no SEO mode the key-switch has direct shut-off access to the injector stages (OUT1-4) and to the starter relay drivers (OUT13 and OUT14).

An additional feature for the starter delay drivers is that the starters are only shut-off after the time delay THOLD if the SEO condition is still active.

The ignition stages are not affected by the SEO signal. This is different from the WDA signal which additionally switches off the ignition stages.

To avoid misunderstandings one must be aware that the SEO function has nothing to do with the WDA function and is not a part of the WDA module. The SEO function is related to the key switch, not to the WDA function. The SEO function adds an additional safety procedure for switching off.

Other functions than the injector stages and the starter relay drivers are not affected or influenced by the SEO signal.

With the falling edge of KEY_ON a timer is started which disables the mentioned power stages after 200 ms to 250 ms (typ. 225 ms). The timer is clocked by an internal oscillator. The timer does not depend on any μC clock or function. The μC still has control on switching on/off drivers during SEO time. This function is configured by CONFIG_REG6 register.
