

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# Introduction

## High-side switches

ST's offer of fully-protected automotive high-side switches (HSDs) is the broadest in the market. Having an unmatched range of packages, on-resistances, number of output channels and diagnostic options, HSDs are able to drive resistive, inductive and capacitive grounded loads in compliance with the stringent safety and reliability requirements of automotive applications.

Based on its proprietary VIPower™ technology, ST's high-side switches have 3 V and 5 V CMOS compatible I/Os for control and vertical mosfet for the power outputs, and are the perfect companions for a microcontroller.

### VIPower™ MO-7 SERIES

The MO-7 series is the ultimate VIPower product generation, born to deliver the widest range of on-state resistance and number of channels with full pin-to-pin compatibility in the smallest packages. Further application benefits are:

- Best-in-class EMI performance, short-circuit protection and robustness
- Lower quiescent current
- Precise load-current, battery voltage and device temperature analog feedback

### VIPower™ MO-5 SERIES

The MO-5 series is the largest family of VIPower high-side switches developed to drive any kind of automotive load.

The devices are equipped with digital status or analog current sense feedback. Further advantages are available in the MO-5Enhanced options:

4

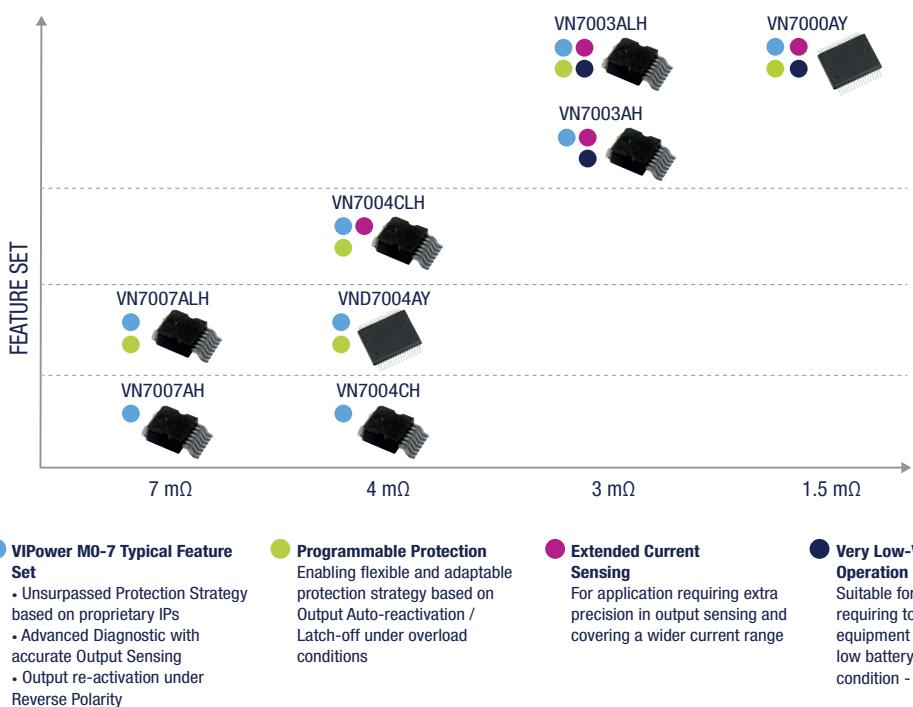

- Extended load compatibility due to higher current limitation
- Instantaneous diagnosis of short-to-ground or overload
- OFF-state diagnosis for the analog current sense option ('E' types)

# VIPower™ Zero series

ST's VIPower™ Zero series offers innovative and high-performance protected switches for driving high power applications. This series covers today's growing demand for intelligent power devices able to drive and protect high-power loads such as those used in high-current fan motors, heaters and protected battery lines in electrical power distribution systems.

## KEY FEATURES

- Complete family of low on-resistance protected solutions
- Output re-activation during reverse polarity
- State-of-the-art and adaptable protection strategy
- Sophisticated diagnostics
- Cold-cranking capability (device option)
- Device option with extended diagnostics capability cover a wide range of load currents

5

## Door actuator drivers with embedded Power Management

The new L99DZ1x0 Family brings higher performances in the Door Zone Applications: novel devices embed, in the same package, Power management power supply functionality (including various standby modes, as well as LIN and HS CAN physical communication layers) together with all the Actuators for main Door loads. The two low-drop voltage regulators of the devices supply the system microcontroller and external peripheral loads such as sensors and provide enhanced system standby functionality with programmable local and remote wake-up capability.

An advanced driver provides logic and protection for external Mosfet transistors in H-bridge, or Dual Half Bridge, configuration . Other features include integrated bridges for double door-lock control, mirror fold, and mirror-axis control, together with high-side drivers for bulbs and LEDs control. In addition, high-side drivers allow small resistive loads driving for increasing system integration level. An additional gate drive can control an external MOSFET in high-side configuration to supply a resistive load connected to GND (e.g. mirror heater). An electro-chromic mirror glass can be controlled using the integrated SPI-driven module in conjunction with an external MOS transistor.

All the embedded outputs come with protection and supervision features such as Current Monitor (only for High Side outputs), Overload, Overcurrent, Thermal Warming, Thermal Shutdown (increased up to 175 °C as mimimum threshold) and Themal Expiration. Devices include two Fail safe low side switches that are intended to be used to turn off the gates of the external high-side MOSFETs in the power window h-bridge if a fatal error happens. The ST standard SPI interface (4.0) allows control and diagnosis of the device and enables generic software development.

## Low-side switches

Fully-protected, low-side switches safely drive resistive, inductive and capacitive loads with one terminal connected to the battery, in compliance with the stringent safety and reliability requirements of automotive applications.

ST's low-side switches offer a power output in addition to control and diagnostic function in one single chip and are available with both single- and dual-channel options.

### OMNIFET III

Built in the VIPower M0-5 technology, the OMNIFET III series addresses a broad range of applications in tiny packages, delivering protection and diagnostic features. Key application benefits include:

- Low stand-by current consumption
- Overload and open-load diagnostic
- Optimized EMI performances
- Enhanced short circuit robustness

### OMNIFET AND OMNIFET II

ST offers a wide portfolio of low-side switches suitable for any kind of automotive load and applications rated up to 70 V.

## Door module drivers

ST's door module drivers family is designed for state-of-the-art automotive door electronics. Devices are characterized by a scalable actuator driving concept, which includes packages and software specially designed to satisfy a wide range of door module variants. Drivers support all regular door module loads such as lock motors, mirror levelling and foldering, defroster, electro-chromic mirror glass, window lift and several lighting functions from incandescent bulbs to LEDs.

## Power management ICs for automotive systems

6

Power management ICs come with enhanced power supply functions and they include various standby modes as well as LIN and HS-CAN (also with HS-CAN supporting Partial Network) physical communication layers. They offer two low-drop voltage regulators to supply the system microcontroller and external peripheral loads (sensors) and provide superior system standby functionality with programmable local and remote wake-up capabilities. Other features, like high-side and low-side drivers or operational amplifiers, are embedded to increase the system integration level.

What's more, ST has a wide multifunctional voltage regulator portfolio that meets all automotive infotainment needs. They are protected against load dump and support battery voltage variations and transients, providing multiple linear or switching voltage outputs, with or without an I<sup>2</sup>C bus, and have a very low standby quiescent current.

## Motor control ICs

Taking advantage from the proprietary VIPower™ silicon technology and from miniaturized packaging solutions, the VNH family of fully integrated H-bridges combines in single packages a matchless level of diagnostic and sensing capabilities together with solid protections and robust vertical structure MOSFETs making automotive DC motor control applications - ranging from a few up to hundreds of watts - more robust and compact.

# High-side switches

## HIGH-SIDE SWITCHES – SINGLE-CHANNEL

| Part number  | Package     | Supply voltage ( $V_{cc}$ ) |         | Absolute max supply voltage (V) | On-state resistance $R_{DS(on)}$ (mΩ) | Output current limit ( $I_{lim}$ ) (A) | Diagnostic feedback  | Short-circuit protection |
|--|-------------|-----------------------------|---------|---------------------------------|---------------------------------------|--|----------------------|--------------------------|
|  |             | Min (V)                     | Max (V) |                                 |                                       |  |                      |                          |

# Development support tools

## TwisterSIM

TwisterSIM is a unique electro-thermal simulator that helps shorten the design solution cycle by enabling complex engineering evaluations. TwisterSIM is available for download at [www.st.com/twistersim](http://www.st.com/twistersim).

## FEATURES

- Accurate dynamic simulations of load compatibility
- Wiring harness optimization
- Fault condition impact analysis
- Diagnostic behavior analysis
- Dynamic thermal performance

## VIPower Smart Finder

Find the right VIPower high/low-side switch and H-bridge device for your Automotive application using Android™ and iOS™ portable devices.  
Download VIPower Smart Finder for free at [www.st.com/vipower-finder](http://www.st.com/vipower-finder)

## FEATURES

- Smart parametric or part number search capability for product
- Technical datasheet downloading and off-line consulting
- Access to main product specifications: electrical parameters, product general description, key features and marketing status
- “Add to Favorites” the selected products and datasheets
- Ability to share technical documentation via social media or e-mail

## EZ-Boards

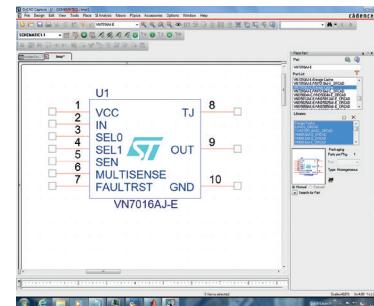

[www.st.com/automotive\\_evalboards](http://www.st.com/automotive_evalboards)

## M0-7 sample kits

Order code: SAMPLEKITM0-7

## OrCAD models
