Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

CMOS LSI

Capacitance-Digital-Converter LSI for Electrostatic Capacitive Touch Sensors

ON Semiconductor®

http://onsemi.com

Overview

The LC717A10AJ is a high-performance and low-cost capacitance-digital-converter LSI for electrostatic capacitive touch sensor, especially focused on usability.

It has 16 channels capacitance-sensor input. This makes it ideal for use in the products that need many switches.

Since the calibration function and the judgment of ON/OFF are automatically performed in LSI internal, it can make development time more short. A detection result (ON/OFF) for each input can be read out by the serial interface (I^2C compatible bus or SPI).

Also, measurement value of each input can be read out as 8-bit digital data. Moreover, gain and other parameters can be adjusted using serial interface.

Features

- Detection system: Differential capacitance detection (Mutual capacitance type)
- Input capacitance resolution: Can detect capacitance changes in the femto Farad order
- Measurement interval (16 differential inputs): 30ms (Typ) (at initial configuration),
  6ms (Typ) (at minimum interval configuration)
- External components for measurement: Not required
- Interface: I^2C * compatible bus or SPI selectable.
- Current consumption: 570μA (Typ) (V_{DD} = 2.8V), 1.3mA (Typ) (V_{DD} = 5.5V)
- Supply voltage: 2.6V to 5.5V
- Detection operations: Switch
- Packages: SSOP30

* I^2C Bus is a trademark of Philips Corporation.

LC717A10AJ

Specifications

Absolute Maximum Ratings at Ta = +25°C

Parameter	Symbol	Ratings (V$_{SS}$ = 0V)	Unit	Remarks
Supply voltage	V$_{DD}$	-0.3 to +6.5	V	
Input voltage	V$_{IN}$	-0.3 to V$_{DD}$+0.3	V	*1
Output voltage	V$_{OUT}$	-0.3 to V$_{DD}$+0.3	V	*2
Power dissipation	Pd max	160	mW	Ta = +105°C, Mounted on a substrate *3
Storage temperature	Tstg	-55 to +125	°C	

*1) Apply to Cin0 to 15, Cref, CrefAdd, nRST, SCL, SDA, SA0, SA1, SCK, SI, nCS

*2) Apply to Cdrv, SDA, SO, INTOUT

*3) Single-layer glass epoxy board (76.1×114.3×1.6t mm)

> Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

Recommended Operating Conditions

Parameter	Symbol	Conditions	min	typ	max	Unit	Remarks
Operating supply voltage	V$_{DD}$		2.6		5.5	V	
Supply ripple + noise	Vpp				±20	mV	*1
Operating temperature	Topr		-40	25	105	°C	

*1) We recommend connecting large and small capacitance between V$_{DD}$ and V$_{SS}$.
In this case, the small capacitance is equal to or more than 0.1μF, and layout nearby LSI.

Electrical Characteristics at V$_{SS}$ = 0V, V$_{DD}$ = 2.6 to 5.5V, Ta = -40 to +105°C

* Unless otherwise specified, the Cdrv drive frequency is f$_{CDRV}$ = 143kHz.

* Not tested at low temperature before shipment.

Parameter	Symbol	Conditions	min	typ	max	Unit	Remarks
Capacitance detection resolution	N				8	bit	
Output noise RMS	N$_{RMS}$	minimum gain setting			±1.0	LSB	*1 *3
Input offset capacitance adjustment range	Coff$_{RANGE}$			±8.0		pF	*1 *3
Input offset capacitance adjustment resolution	Coff$_{RESO}$			8		bit	
Cin offset drift	Cin$_{DRIFT}$	minimum gain setting			±8	LSB	*1
Cin detection sensitivity	Cin$_{SENSE}$	minimum gain setting	0.04		0.12	LSB/fF	*2
Cin pin leak current	I$_{Cin}$	Cin = Hi-Z		±25	±500	nA	
Cin allowable parasitic input capacitance	Cin$_{SUB}$	Cin against V$_{SS}$			30	pF	*1 *3
Cdrv drive frequency	f$_{CDRV}$		100	143	186	kHz	
Cdrv pin leak current	I$_{CDRV}$	Cdrv = Hi-Z		±25	±500	nA	
nRST minimum pulse width	t$_{NRST}$		1			μs	*1
Power-on reset time	t$_{POR}$				20	ms	*1
Power-on reset operation condition: Hold time	t$_{POROP}$		10			ms	*1
Power-on reset operation condition: Input voltage	V$_{POROP}$				0.1	V	*1
Power-on reset operation condition: Power supply rise rate	t$_{VDD}$	0V to V$_{DD}$	1			V/ms	*1

Output low impedance time from SCK clock	t_{CLZ}	SCK SO		0			ns	*1

*1) Design guarantee values (not tested before shipment)

LC717A10AJ

Power-on Reset (POR)

When power is turned on, power-on reset is enabled inside the LSI and its state is released after a certain power-on reset time, t_{POR}. Power-on Reset operation condition; Power supply rise rate t_{VDD} must be at least 1V/ms.

Since INTOUT pin changes from "High" to "Low" at the same time as the released of power-on reset, it is possible to verify the timing of release of power-on reset externally.
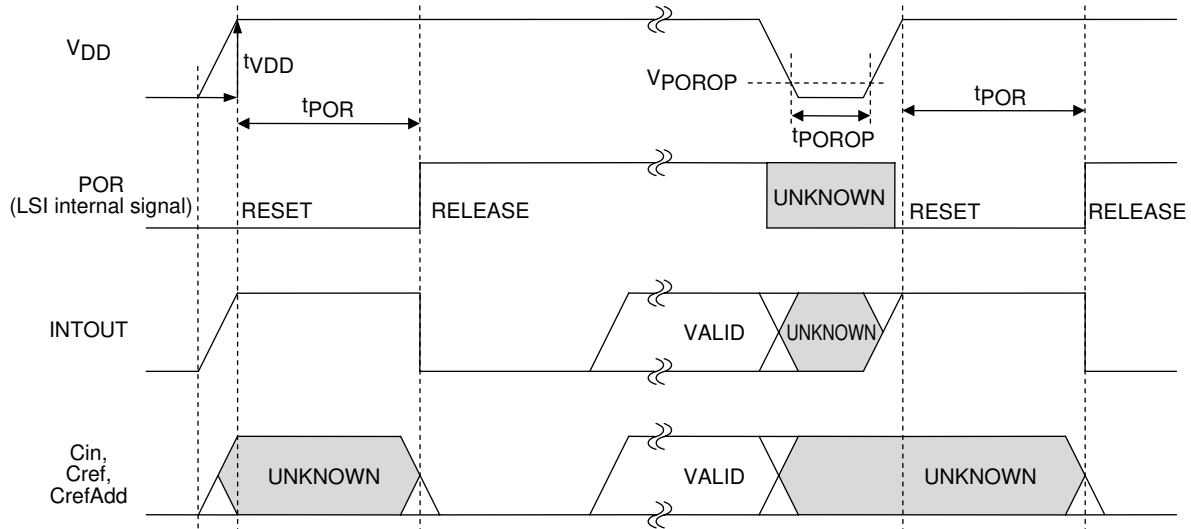

During power-on reset, Cin, Cref and CrefAdd are unknown.

Block Diagram
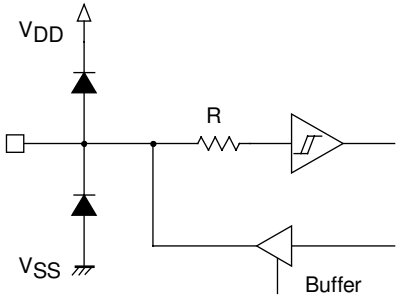

LC717A10AJ is capacitance-digital-converter LSI capable of detecting changes in capacitance in the order of femto Farads. It consists of an oscillation circuit that generates the system clock, a power-on reset circuit that resets the system when the power is turned on, a multiplexer that selects the input channels, a two-stage amplifier that detects the changes in the capacitance and outputs analog-amplitude values, a A/D converter that converts the analog-amplitude values into digital data, an I^2C compatible bus or a SPI that enables serial communication with external devices and a control logic that controls the entire chip.

Pin Functions

Pin Name	I/O	Pin Functions	Pin Type
Cin0	I/O	Capacitance sensor input	
Cin1	I/O	Capacitance sensor input

SDA/SI	I/O	Data input and output (I^2C) / Data input (SPI)	

Continued to the next page.

Continued from the previous page.

Pin Name	I/O	Pin Functions	Pin Type
SA0/SO	I/O	Slave address selection (I^{2}C) / Data output (SPI)	
V$_{DD}$		Power supply (2.6V to 5.5V) *1	
V$_{SS}$		Ground (Earth) *1 *2	

*1) Inserting a high-valued capacitor and a low-valued capacitor in parallel between V$_{DD}$ and V$_{SS}$ is recommended.
      In this case, the small-valued capacitor should be at least 0.1μF, and is mounted near the LSI.
*2) When V$_{SS}$ terminal is not grounded in battery-powered mobile equipment, detection sensitivity may be degraded.

Details of Pin Functions

●Cin0 to Cin15
   These are the capacitance-sensor-input pins. These pins are used by connecting them to the touch switch pattern.
   Cin and the Cdrv wire patterns should be close to each other. By doing so, Cdrv and Cin patterns are capacitively
   coupled. Therefore, LSI can detect capacitance change near each pattern as 8bit digital data.
   However, if the shape of each pattern or the capacitively coupled value of Cdrv is not appropriate, it may not be able
   to detect the capacitance change correctly.
   In this LSI, there is a two-stage amplifier that detects the changes in the capacitance and outputs analog-amplitude
   values. Cin0 to Cin15 are connected to the inverting input of the 1st amplifier.
   During measurement process, channels other than the one being measured are all in "Low" condition.
   Leave the unused terminals open.

●Cref, CrefAdd
   These are the reference-capacitance-input pins. These are used by connecting to the wire pattern like Cin pins or are
   used by connecting any capacitance between this pin and Cdrv pin.
   In this LSI, there is a two-stage amplifier that detects the changes in the capacitance and outputs analog-amplitude
   values. Cref is connected to the non-inverting input of the 1st amplifier.
   Due to the parasitic capacitance generated in the wire connections of Cin pins and their patterns, as well as the one
   generated between the wire patterns of Cin and Cdrv pins, Cref may not detect capacitance change of each Cin pin
   accurately. In this case, connect an appropriate capacitance between Cref and Cdrv to detect capacitance change
   accurately.
   However, if the difference between the parasitic capacitance of each Cin pin is extremely large, it may not detect
   capacitance change of each Cin pin correctly.
   CrefAdd can be used as additional terminal for Cref. Leave the CrefAdd open if not in used.

●Cdrv
   It is the output pin for capacitance sensors drive. It outputs the pulse voltage which is needed to detect capacitance at
   Cin0 to Cin15.
   Cdrv and Cin wire patterns should be close to each other so that they are capacitively coupled.

●INTOUT
   It is the interrupt-output pin.
   It is used by connecting to a main microcomputer if necessary, and use as interrupt signal. (High Active)
   Leave the terminal open if not in used.

●SCL/SCK
   Clock input (I^{2}C) / Clock input (SPI)
   It is the clock input pin of the I^{2}C compatible bus or the SPI depending on the mode of operation.

●nCS

Interface selection / Chip-select-inverting input (SPI)

Selection of I^2C compatible bus mode or SPI mode is through this terminal. After initialization, the LSI is automatically in I^2C compatible bus mode. To continually use I^2C compatible bus mode, fix nCS pin to "High". To switch to SPI mode after LSI initialization, change the nCS input "High" → "Low". The nCS pin is used as the chip-select-inverting input pin of SPI, and SPI mode is kept until LSI is again initialized.

●nRST

It is the external-reset-signal-inverting-input pin. When nRST pin is "Low", LSI is in reset state.
Each pin (Cin0 to 15, Cref, CrefAdd) is "Hi-Z" during reset state.

●SDA/SI

Data input and output (I^2C) / Data input (SPI)

It is the data input and output pin of the I^2C compatible bus or the data input pin of the SPI depending on the mode of operation.

●SA0/SO

Slave address selection (I^2C) / Data output (SPI)

It is the slave address selection pin of the I^2C compatible bus or the data output pin of the SPI depending on the mode of operation.

●SA1

Slave address selection (I^2C)

It is the slave address selection pin of the I^2C compatible bus.
When SPI mode, connect to the SA1 pin to GND.
