

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Features

- Very high speed: 45 ns
- Temperature ranges
 - Industrial: -40 °C to +85 °C
- Wide voltage range: 2.20 V–3.60 V
- Pin compatible with CY62137CV/CV25/CV30/CV33, CY62137V, and CY62137EV30
- Ultra low standby power
 - Typical standby current: 1 μA
 - Maximum standby current: 5 μA (Industrial)
- Ultra low active power
 - Typical active current: 1.6 mA at f = 1 MHz (45 ns speed)
- Easy memory expansion with \overline{CE} and \overline{OE} features
- Automatic power down when deselected
- Complementary metal oxide semiconductor (CMOS) for optimum speed and power
- Byte power down feature
- Available in Pb free 48-ball very fine-pitch ball grid array (VFBGA) and 44-pin thin small outline package (TSOP) II package

Functional Description

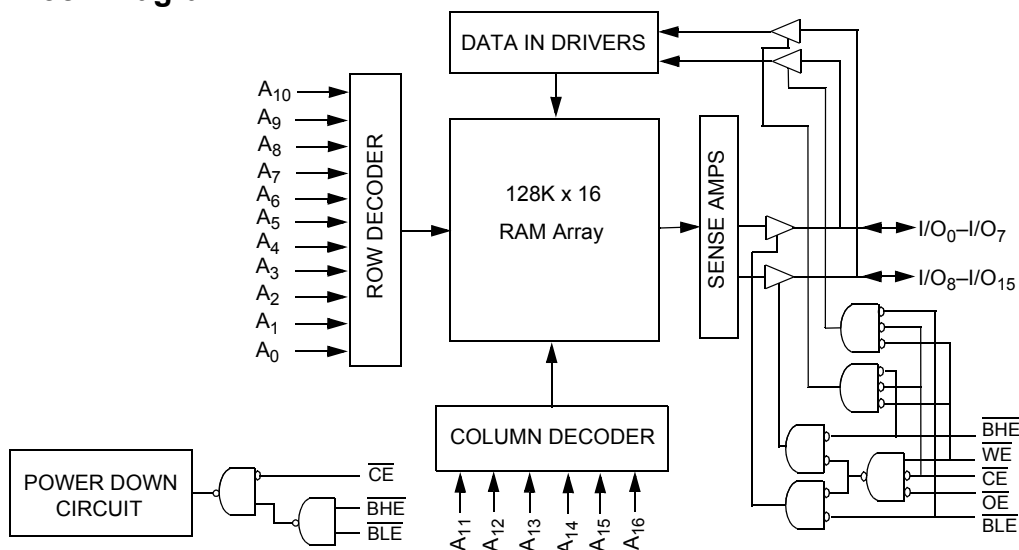

The CY62137FV30 is a high performance CMOS static RAM organized as 128K words by 16 bits. This device features

advanced circuit design to provide ultra low active current. This is ideal for providing More Battery Life™ (MoBL[®]) in portable applications such as cellular telephones. The device also has an automatic power down feature that significantly reduces power consumption when addresses are not toggling. Placing the device into standby mode reduces power consumption by more than 99% when deselected (\overline{CE} HIGH or both \overline{BLE} and \overline{BHE} are HIGH). The input and output pins (I/O₀ through I/O₁₅) are placed in a high impedance state in the following conditions when the device is deselected (\overline{CE} HIGH), the outputs are disabled (\overline{OE} HIGH), both the Byte High Enable and the Byte Low Enable are disabled (\overline{BHE} , \overline{BLE} HIGH), or during an active write operation (\overline{CE} LOW and \overline{WE} LOW).

Write to the device by taking Chip Enable (\overline{CE}) and Write Enable (\overline{WE}) inputs LOW. If Byte Low Enable (\overline{BLE}) is LOW, then data from I/O pins (I/O₀ through I/O₇) is written into the location specified on the address pins (A₀ through A₁₆). If Byte High Enable (\overline{BHE}) is LOW, then data from I/O pins (I/O₈ through I/O₁₅) is written into the location specified on the address pins (A₀ through A₁₆).

Read from the device by taking Chip Enable (\overline{CE}) and Output Enable (\overline{OE}) LOW, while forcing the Write Enable (\overline{WE}) HIGH. If Byte Low Enable (\overline{BLE}) is LOW, then data from the memory location specified by the address pins appear on I/O₀ to I/O₇. If Byte High Enable (\overline{BHE}) is LOW, then data from memory appears on I/O₈ to I/O₁₅. See the Truth Table on page 11 for a complete description of read and write modes.

Notes

- V_{IL(min)} = -2.0 V for pulse durations less than 20 ns.
- V_{IH(max)} = V_{CC} + 0.75 V for pulse durations less than 20 ns.
- Full device AC operation assumes a minimum of 100 μs ramp time from 0 to V_{CC(min)} and 200 μs wait time after V_{CC} stabilization.
- Typical values are included for reference only and are not guaranteed or tested. Typical values are measured at V_{CC} = V_{CC(typ)}, T_A = 25 °C
- Chip enable (CE) and byte enables (BHE and BLE) need to be tied to CMOS levels to meet the I_{SB1} / I_{SB2} / I_{CCDR} specification. Other inputs can be left floating.

11. Chip enable (CE) and byte enables (BHE and BLE) need to be tied to CMOS levels to meet the I_{SB1} / I_{SB2} / I_{CCDR} specification. Other inputs can be left floating.
12. Tested initially and after any design or process changes that may affect these parameters.
13. Full device operation requires linear V_{CC} ramp from V_{DR} to V_{CC(min)} ≥ 100 μs or stable at V_{CC(min)} ≥ 100 μs.
14. BHE.BLE is the AND of both BHE and BLE. Deselect the chip by either disabling chip enable signals or by disabling both BHE and BLE.

Notes

15. Test conditions for all parameters, other than tristate parameters, assume signal transition time of 3 ns (1 V/ns) or less, timing reference levels of $V_{CC(typ)}/2$, input pulse levels of 0 to $V_{CC(typ)}$, and output loading of the specified I_{OL}/I_{OH} as shown in [AC Test Loads and Waveforms on page 5](#).
16. AC timing parameters are subject to byte enable signals (BHE or BLE) not switching when chip is disabled. Please see [application note AN13842](#) for further clarification.
17. At any temperature and voltage condition, t_{HZCE} is less than t_{LZCE} , t_{HZBE} is less than t_{LZBE} , t_{HZOE} is less than t_{LZOE} , and t_{HZWE} is less than t_{LZWE} for any device.
18. t_{HZOE} , t_{HZCE} , t_{HZBE} , and t_{HZWE} transitions are measured when the outputs enter a high impedance state.
19. If both byte enables are toggled together, this value is 10 ns.
20. The internal write time of the memory is defined by the overlap of \overline{WE} , $\overline{CE} = V_{IL}$, \overline{BHE} and/or $\overline{BLE} = V_{IL}$. All signals are ACTIVE to initiate a write and any of these signals terminate a write by going INACTIVE. The data input setup and hold timing are referenced to the edge of the signal that terminates the write.

Switching Waveforms

Figure 5. Read Cycle 1: Address Transition Controlled [21, 22]

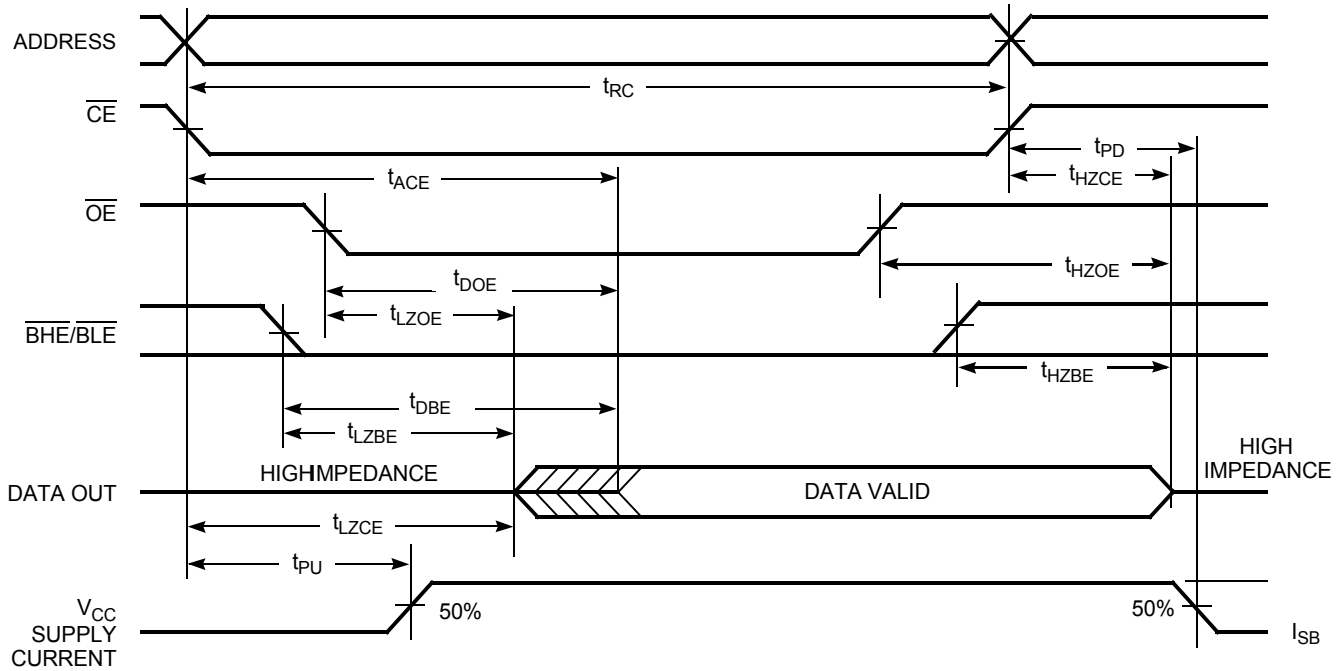

Figure 6. Read Cycle 2: \overline{OE} Controlled [22, 23]

Notes

21. The device is continuously selected. \overline{OE} , \overline{CE} = V_{IL} , \overline{BHE} and/or \overline{BLE} = V_{IL} .
22. \overline{WE} is HIGH for read cycle.
23. Address valid before or similar to \overline{CE} and \overline{BHE} , \overline{BLE} transition LOW.

Switching Waveforms (continued)

Figure 7. Write Cycle 1: $\overline{\text{WE}}$ Controlled [24, 25, 26]

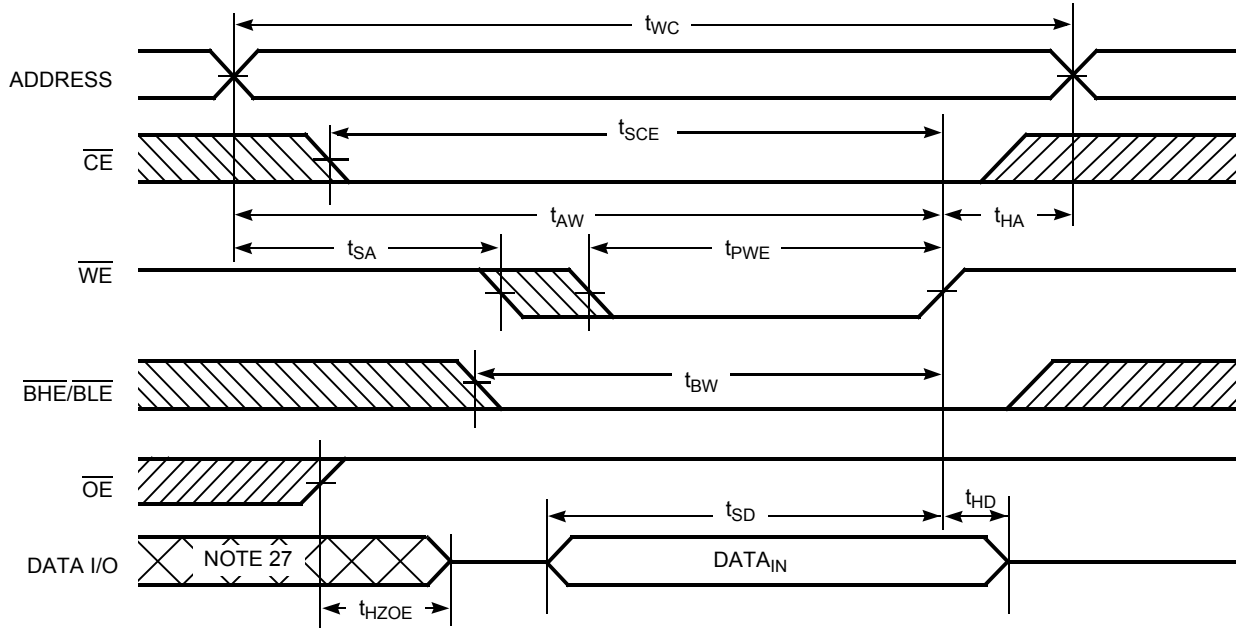

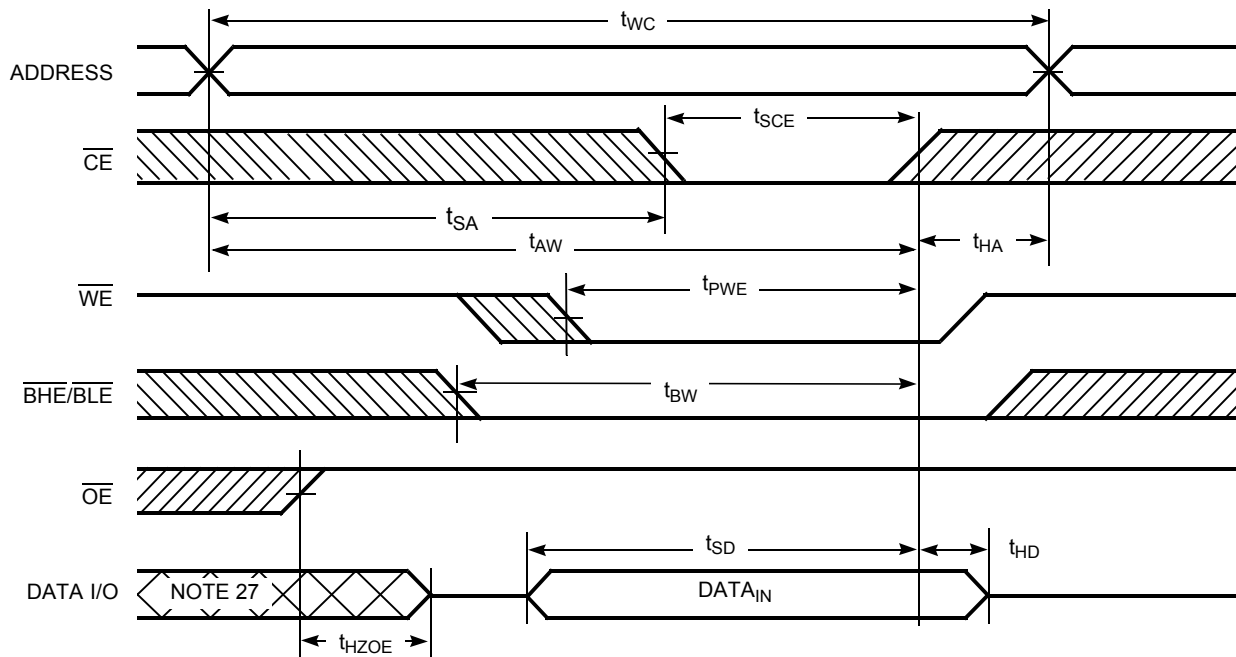

Figure 8. Write Cycle 2: $\overline{\text{CE}}$ Controlled [24, 25, 26]

Notes

- 24. The internal write time of the memory is defined by the overlap of $\overline{\text{WE}}$, $\overline{\text{CE}} = V_{IL}$, $\overline{\text{BHE}}$ and/or $\overline{\text{BLE}} = V_{IL}$. All signals are ACTIVE to initiate a write and any of these signals terminate a write by going INACTIVE. The data input setup and hold timing are referenced to the edge of the signal that terminates the write.
- 25. Data I/O is high impedance if $\overline{\text{OE}} = V_{IH}$.
- 26. If $\overline{\text{CE}}$ goes HIGH simultaneously with $\overline{\text{WE}} = V_{IH}$, the output remains in a high impedance state.
- 27. During this period, the I/Os are in output state. Do not apply input signals.

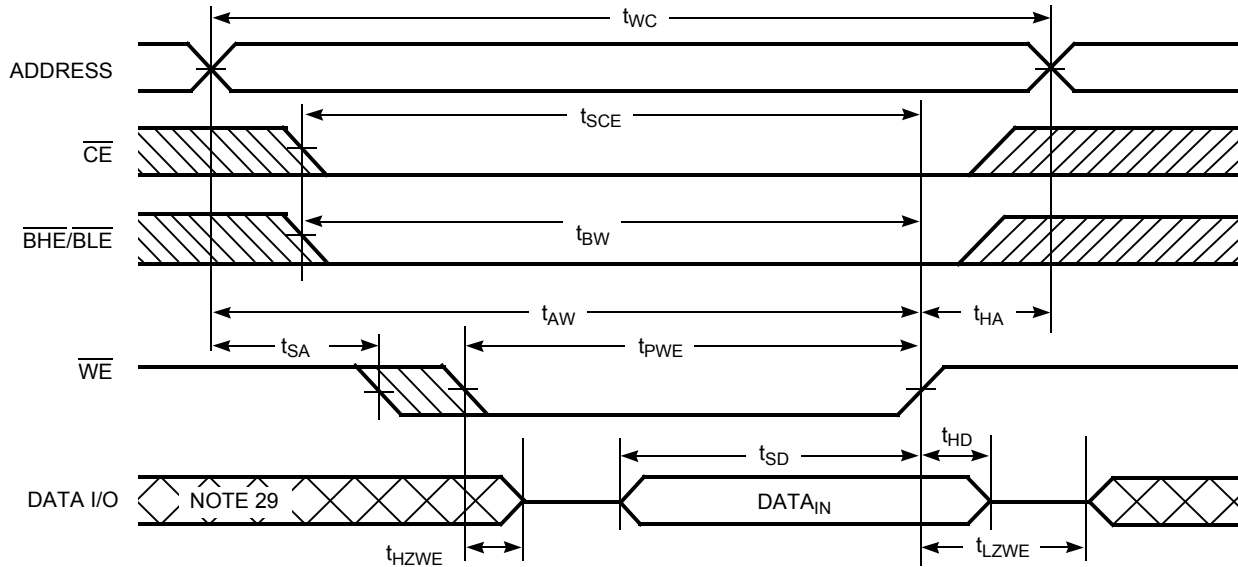

Figure 10. Write Cycle 4: $\overline{BHE}/\overline{BLE}$ Controlled, \overline{OE} LOW [28]

Notes

- 28. If \overline{CE} goes HIGH simultaneously with $\overline{WE} = V_{IH}$, the output remains in a high impedance state.
- 29. During this period, the I/Os are in output state. Do not apply input signals.
