Port Name	Option selected in units of	Option type	Output type	Pull-up resistor
P00 to P07	1 bit	1	CMOS	Programmable (Note 1)
		2	Nch-open drain	No

UHD+, UHD-	-	No	CMOS	No
XT1	-	No	Input only	No
XT2	-	No	32.768kHz crystal resonator output (N channel open drain when in general-purpose output mode)	No

Note 1: Programmable pull-up resistors for port 0 are controlled in 4 bit units (P00 to 03, P04 to 07).

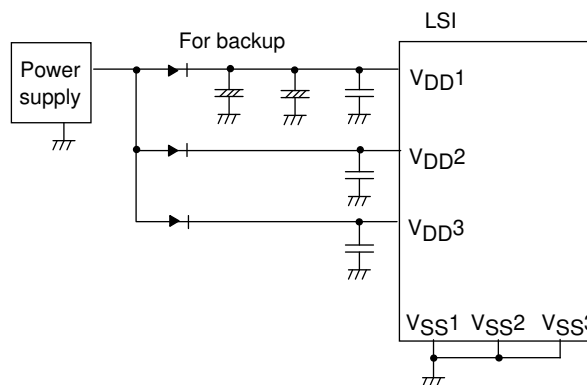

## Power Pin Treatment

Connect the IC as shown below to minimize the noise input to the  $V_{DD1}$  pin. and extend the backup period. Be sure to electrically short the  $V_{SS1}$ ,  $V_{SS2}$ , and  $V_{SS3}$  pins.

Example 1: When the microcontroller is in the backup state in the HOLD mode, the power to sustain the high level of output ports is supplied by their backup capacitors.

Example 2: The high level output at ports is not sustained and unstable in the HOLD backup mode.

## USB Reference Power Option

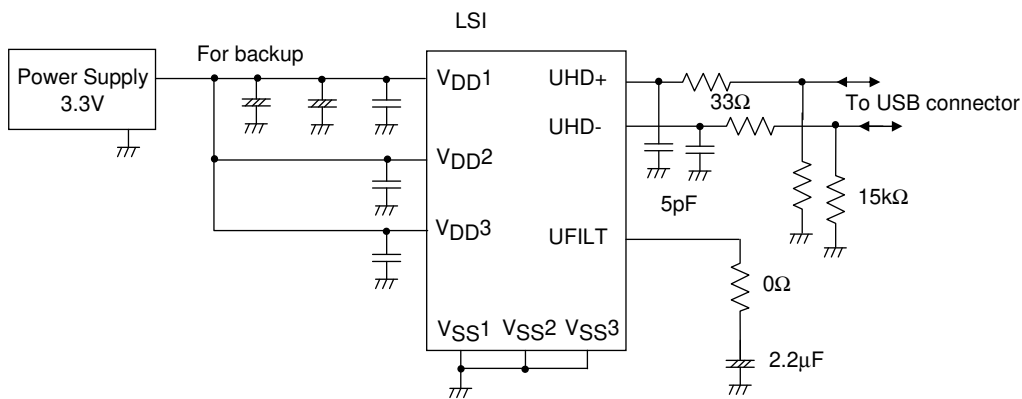

When a voltage 4.5 to 5.5V is supplied to  $V_{DD1}$  and the internal USB reference voltage circuit is activated, the reference voltage for USB port output is generated. The active/inactive state of the reference voltage circuit can be switched by option select. The procedure for marking the option selection is described below.

		(1)	(2)	(3)	(4)
Option settings	USB regulator	USE	USE	USE	NONUSE
	USB regulator at HOLD mode	USE	NONUSE	NONUSE	NONUSE
	USB regulator at HALT mode	USE	NONUSE	USE	NONUSE
Reference voltage circuit state	Normal mode	active	active	active	inactive
	HOLD mode	active	inactive	inactive	inactive
	HALT mode	active	inactive	active	inactive

- When the USB reference voltage circuit is made inactive, the level of the reference voltage for USB port output is equal to  $V_{DD1}$ .
- Selection (2) or (3) can be used to set the reference voltage circuit inactive in HOLD or HALT mode.
- When the reference voltage circuit is activated, the current drain increases by approximately 100 $\mu$ A compared with when the reference voltage circuit is inactive.

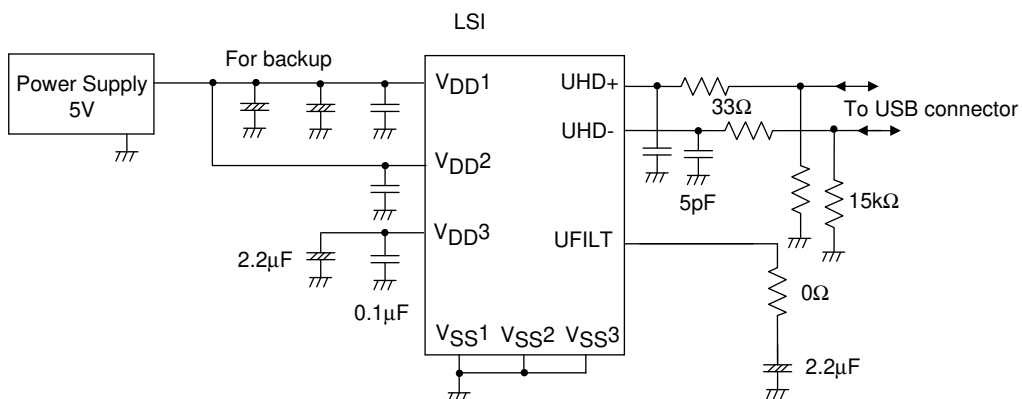

Example 1:  $V_{DD1}=V_{DD2}=3.3V$

- Inactivating the reference voltage circuit (selection (4)).
- Connecting  $V_{DD3}$  to  $V_{DD1}$  and  $V_{DD2}$ .

Example 2:  $V_{DD1}=V_{DD2}=5.0V$

- Activating the reference voltage circuit (selection (1)).
- Isolating  $V_{DD3}$  from  $V_{DD1}$  and  $V_{DD2}$ , and connecting capacitor between  $V_{DD3}$  and  $V_{SS}$ .

## Characteristics of a Sample Main System Clock Oscillation Circuit

Given below are the characteristics of a sample main system clock oscillation circuit that are measured using a Our designated oscillation characteristics evaluation board and external components with circuit constant values with which the oscillator vendor confirmed normal and stable oscillation.

Table 1 shows the characteristics of a oscillation circuit when USB host function is not used.

If USB host function is to be used, it is absolutely recommended to use an oscillator that satisfies the precision and stability according to the USB standards.

Table 1 Characteristics of a Sample Main System Clock Oscillator Circuit with a Ceramic Oscillator

Nominal Frequency	Vendor Name	Oscillator Name	Circuit Constant			Operating Voltage Range [V]	Oscillation Stabilization Time		Remarks
			C1 [pF]	C2 [pF]	Rd1 [ $\Omega$ ]		typ [ms]	max [ms]	
6MHz	MURATA	CSTCR6M00GH5L**-R0	(39)	(39)	1k	2.7 to 5.5	0.1	0.5	C1 and C2 integrated SMD type
8MHz	MURATA	CSTCE8M00GH5L**-R0	(33)	(33)	470	3.0 to 5.5	0.1	0.5	
10MHz	MURATA	CSTCE10M0GH5L**-R0	(33)	(33)	330	3.0 to 5.5	0.1	0.5	
12MHz	MURATA	CSTCE12M0GH5L**-R0	(33)	(33)	330	3.0 to 5.5	0.1	0.5	

The oscillation stabilization time refers to the time interval that is required for the oscillation to get stabilized in the following cases (see Figure 4):

- Till the oscillation gets stabilized after  $V_{DD}$  goes above the operating voltage lower limit.
- Till the oscillation gets stabilized after the instruction for starting the main clock oscillation circuit is executed
- Till the oscillation gets stabilized after the HOLD mode is reset.
- Till the oscillation gets stabilized after the X'tal HOLD mode is reset with CFSTOP (OCR register, bit 0) set to 0

## Characteristics of a Sample Subsystem Clock Oscillator Circuit

Given below are the characteristics of a sample subsystem clock oscillation circuit that are measured using a Our designated oscillation characteristics evaluation board and external components with circuit constant values with which the oscillator vendor confirmed normal and stable oscillation.

Table 2 Characteristics of a Sample Subsystem Clock Oscillator Circuit with a Crystal Oscillator

Nominal Frequency	Vendor Name	Oscillator Name	Circuit Constant				Operating Voltage Range [V]	Oscillation Stabilization Time		Remarks
			C3 [pF]	C4 [pF]	Rf [ $\Omega$ ]	Rd2 [ $\Omega$ ]		typ [s]	max [s]	
32.768kHz	EPSON TOYOCOM	MC-306	18	18	OPEN	560k	2.7 to 5.5	1.1	3.0	Applicable CL value=12.5pF SMD type

The oscillation stabilization time refers to the time interval that is required for the oscillation to get stabilized in the following cases (see Figure 4):

- Till the oscillation gets stabilized after the instruction for starting the subclock oscillation circuit is executed
- Till the oscillation gets stabilized after the HOLD mode is reset with EXTOSC (OCR register, bit 6) set to 1

Note: The components that are involved in oscillation should be placed as close to the IC and to one another as possible because they are vulnerable to the influences of the circuit pattern.
