

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

1.2 A low quiescent current LDO with reverse current protection

Datasheet - production data

Features

- Input voltage from 1.6 to 5.5 V
- Very low-dropout voltage (300 mV typ. at 1 A load)
- Low quiescent current (35 µA typ. at no-load, 1 µA max. in off mode)
- Output voltage tolerance: ± 2.0% at 25 °C
- 1.2 A guaranteed output current
- Wide range of output voltages available on request: 0.8 V to 5 V with 50 mV step and adjustable
- Logic-controlled electronic shutdown
- Compatible with ceramic capacitor $C_{OUT} = 1 \mu F$
- Internal current and thermal limit
- Available in DFN6 (2x2), DFN6 (3x3) mm, SO8-batwing and PPAK packages
- Temperature range: -40 °C to 125 °C
- Reverse current protection
- Output discharge function (optional)

Applications

- Consumer
- Computer
- Battery-powered systems
- Low voltage point-of-load
- USB-powered devices

Description

The LDL112 is a low-dropout linear regulator, which can provide a maximum current of 1.2 A, with a typical dropout voltage of 300 mV.

It is stabilized with a ceramic capacitor on the output.

The very low drop voltage, low quiescent current and reverse current protection features make it suitable for low power battery-powered applications.

The enable logic control function puts the LDL112 in shutdown mode allowing a total current consumption lower than 1 µA.

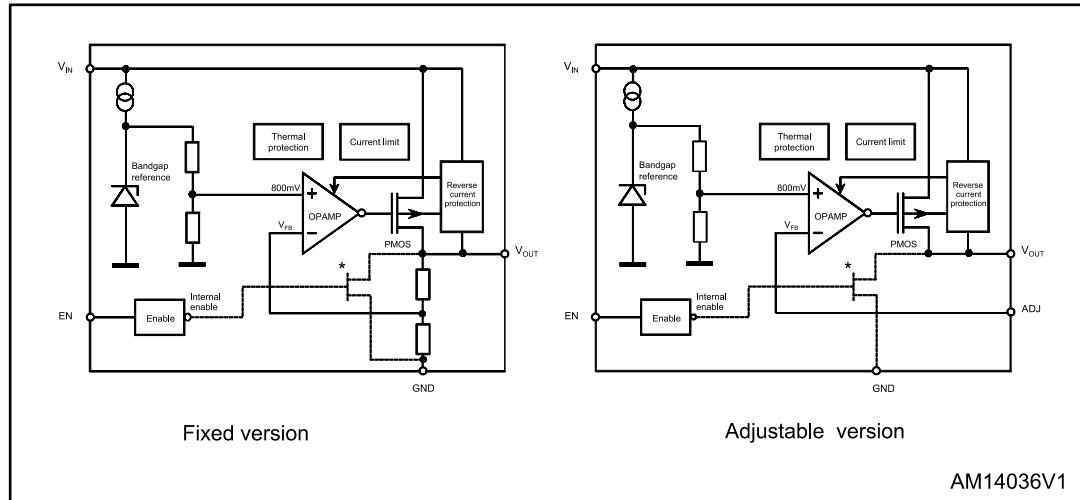

The device is equipped with current limit and thermal protection.

4 Maximum ratings

Table 2: Absolute maximum ratings

Symbol	Parameter	Value	Unit
V_{IN}	DC input voltage	- 0.3 to 7	V
V_{OUT}	DC output voltage	- 0.3 to $V_I + 0.3$	V
V_{EN}	Enable input voltage	- 0.3 to $V_I + 0.3$	V
V_{ADJ}	ADJ pin voltage	2	V
I_{OUT}	Output current	Internally limited	mA
P_D	Power dissipation	Internally limited	mW
T_{STG}	Storage temperature range	- 65 to 150	°C
T_{OP}	Operating junction temperature range	- 40 to 125	°C

Absolute maximum ratings are those values beyond which damage to the device may occur. Functional operation under these conditions is not implied. All values are referred to GND.

Table 3: Thermal data

Symbol	Parameter	DFN6 (3x3)	DFN6 (2x2)	SO8	PPAK	Unit
R_{thJA}	Thermal resistance junction-ambient	55	65	55 ⁽¹⁾	100	°C/W
R_{thJC}	Thermal resistance junction-case	10	15	20	8	°C/W

Notes:

⁽¹⁾Considering 6 cm² of copper board heatsink.

5 Electrical characteristics

$T_J = 25^\circ\text{C}$, $V_{IN} = V_{OUT(NOM)} + 0.5 \text{ V}$ (for $V_{OUT(NOM)} \leq 1 \text{ V}$, $V_{IN} = 2.1 \text{ V}$), $C_{IN} = C_{OUT} = 1 \mu\text{F}$, $I_{OUT} = 5 \text{ mA}$, $V_{EN} = V_{IN}$, unless otherwise specified.

Table 4: LDL112 electrical characteristics (fixed version)

Symbol	Parameter	Test conditions	Min.	Typ.	Max.	Unit
V_{IN}	Operating input voltage		1.6		5.5	V
V_{OUT}	V_{OUT} accuracy	$I_{OUT} = 5 \text{ mA}, T_J = 25^\circ\text{C}$	-2.0		2.0	%
		$I_{OUT} = 5 \text{ mA}, -40^\circ\text{C} < T_J < 125^\circ\text{C}$	-3.0		3.0	%
ΔV_{OUT}	Static line regulation ⁽¹⁾	$V_{OUT(NOM)} + 0.5 \text{ V} < V_{IN} \leq 5.5 \text{ V}$ ⁽²⁾		0.05	0.1	%/V

T_{SHDN}	Thermal shutdown			165		$^\circ\text{C}$
	Hysteresis			20		
C_{OUT}	Output capacitor	Capacitance (see Section 7: "Typical performance characteristics")	1		10	μF

Notes:

⁽¹⁾Not applicable for $V_{out(nom)} > 4.5\text{ V}$.

⁽²⁾For V_{out} lower than or equal to 1 V , $V_{IN} = 2.1\text{ V}$.

⁽³⁾Dropout voltage is the input-to-output voltage difference at which the output voltage is 100 mV below its nominal value.

6 Application information

6.1 Thermal and short-circuit protections

The LDL112 is self-protected from short-circuit condition and overtemperature. When the output load is higher than the one supported by the device, the output current increases until the limit of typically 2 A is reached, at this point the current is kept constant even when the load impedance is zero.

Thermal protection acts when the junction temperature reaches 165 °C, therefore the IC shuts down. As soon as the junction temperature falls again below the thermal hysteresis value the device starts working again.

In order to calculate the maximum power that the device can dissipate, keeping the junction temperature below the T_{OP} , the following formula is used:

Equation 1

$$P_{DMAX} = (125 - T_{AMB}) / R_{THJA}$$

6.2 Output voltage setting for ADJ version

In the adjustable version, the output voltage can be set from 0.8 V up to the input voltage minus the voltage drop across the pass transistor (dropout voltage), by connecting a resistor divider between the ADJ pin and the output, thus allowing remote voltage sensing.

The resistor divider could be selected by the following equation:

Equation 2

$$V_{OUT} = V_{ADJ} \left(1 + R1 / R2\right), \text{ with } V_{ADJ} = 0.8 \text{ V (typ.)}$$

It is recommended to use resistors with values in the range of 10 kΩ to 50 kΩ. Lower values can also be suitable, but current consumption increases.

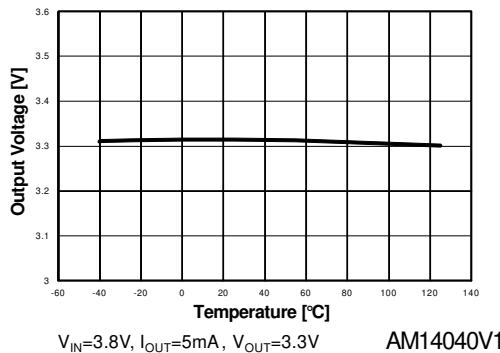

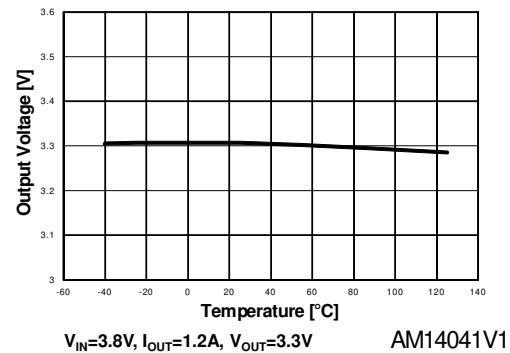

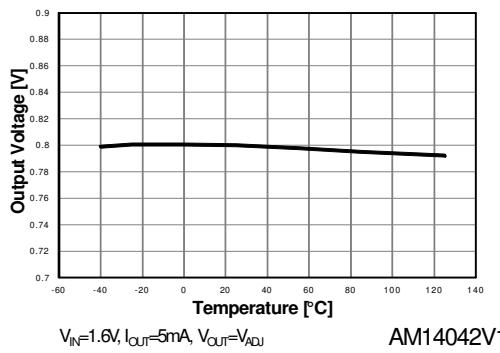

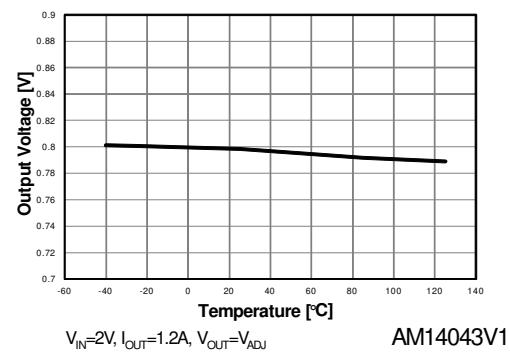

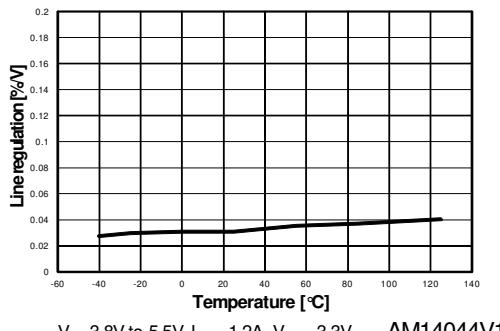

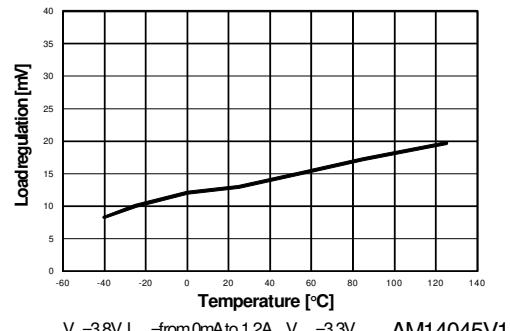

6.3 Reverse current protection

The device avoids the reverse current to flow from output to input during any operating condition (with enable pin in high or low status). The reverse current protection acts in particular during fast turning on/off operations or when another power supply (with higher voltage than the input one) is connected to the output port. If a power supply with lower voltage than the LDO output voltage is connected to V_{OUT} pin, LDO enters the current protection status, causing high power dissipation.

In the application, the LDL112 reverse current protection acts in the following cases:

1. **Off-state, EN pin is at GND level, $V_{OUT} > [V_{IN} + 100 \text{ mV}]$.** In this case the device power pass element (MOSFET) is off, the bulk and gate are switched to V_{OUT} and therefore all possible current paths from V_{OUT} to V_{IN} are interrupted.
2. **On-state, EN pin is at high level and $V_{OUT} > V_{OUT(\text{nominal})}$.** In this condition, V_{OUT} is higher than the nominal level, so the device op-amp works in open loop and the power element is off. V_{GS} is zero, the bulk and gate are switched to V_{OUT} (where $V_{OUT} > [V_{IN} + 100 \text{ mV}]$) therefore all possible current paths from V_{OUT} to V_{IN} are interrupted.
3. **On-state, EN pin is at high level and $V_{OUT} < V_{OUT(\text{nominal})}$.** In this condition V_{OUT} is lower than the nominal level, so the op-amp works in open loop with the power MOSFET on. V_{GS} is maximal so the power channel conducts with very low $R_{DS(on)}$. When $V_{OUT} > V_{IN}$ the current can flow from V_{OUT} to V_{IN} until the condition $V_{OUT} > (V_{IN} + 100 \text{ mV})$ is reached.
