Description

- High Holdover Capability PTP, 1588 Clock Module.
Designed to provide easy-to-use holdover capability for GPS receivers. Ideal protection against deliberate or accidental GPS jamming and weather-related outages
Applications include Base Station, Clock Source, Clock Server and IP Backhaul
Supports IEEE 1588V2 can be 1588 master or slave
Holdover stability up to 1.5µs over 24hours, achieved using an adaptive algorithm.
Internal parameters of the algorithm, including maintenance alarms and me
- Model IQCM-300
- Model Issue number 1
- Working States (Reference Drawing):
Run1: Fast track. Adjust the OCXO 10MHz output frequency quickly to track the 1PPS to 10MHz with 1PPS reference.
Run2: Slow track. Adjust the OCXO 10MHz output frequency slowly when phase error is in the defined range.
Holdover: No 1PPS input present; an algorithm enables adaptive modelling of the frequency stability of an OCXO with reference to the GPS timing signal.
Free Run: Clock module powered up with no 1PPS input.
- Note1: The IQCM-300 should be left powered and running for 7 days minimum before operation to allow for the OCXO's internal drift to stabilise.
Note2: The adaptive module algorithm can be built after two days operation with good GPS signal, however this data will be lost at power down.
