

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## FEATURES

- Pin Compatible with LH0070 and AD581\*
- Ultralow Drift—5ppm/°C Max Slope
- Trimmed Output Voltage
- Operates in Series or Shunt Mode
- Output Sinks and Sources in Series Mode
- Very Low Noise < 1ppm<sub>P-P</sub> 0.1Hz to 10Hz
- > 100dB Ripple Rejection
- Minimum Input Voltage of 11V

## APPLICATIONS

- A-to-D and D-to-A Converters
- Precision Regulators
- Digital Voltmeters
- Inertial Navigation Systems
- Precision Scales
- Portable Reference Standard

## DESCRIPTION

The LT<sup>®</sup>1031 is a precision 10V reference with ultralow drift and noise, extremely good long term stability, and almost total immunity to input voltage variations. The reference output will both source and sink up to 10mA and can be used as a shunt regulator (two terminal Zener) with the same precision characteristics as the three terminal connection. Special care has been taken to minimize thermal regulation effects and temperature induced hysteresis.

The LT1031 reference is based on a buried Zener diode structure which eliminates noise and stability problems associated with surface breakdown devices. Further, a subsurface Zener exhibits better temperature drift and time stability than even the best band-gap references.

Unique circuit design makes the LT1031 the first three terminal IC reference to offer ultralow drift without the use of high power on-chip heaters. Output voltage is pretrimmed to 0.05% accuracy.

The LT1031 can be used as a plug-in replacement for the AD581 and LH0070,\* with improved electrical and thermal performance.

LT, LTC and LT are registered trademarks of Linear Technology Corporation. All other trademarks are the property of their respective owners. \*See LH0070 Electrical Characteristics table and AD581 cross reference guide.

## TYPICAL APPLICATION

**Basic Positive and Negative Connections**

**Distribution of Output Accuracy**

**ABSOLUTE MAXIMUM RATINGS**

(Note 1)

Input Voltage .....	40V
Input-Output Voltage Differential .....	35V
Output to Ground Voltage (Shunt Mode Current Limit) .....	16V
Trim Pin to Ground Voltage	
Positive .....	Equal to $V_{OUT}$
Negative .....	-20V
Output Short-Circuit Duration	
$V_{IN} = 35V$ .....	10 sec
$V_{IN} \leq 20V$ .....	Indefinite
Operating Temperature Range	
LT1031M .....	-55°C to 125°C
LT1031C .....	0°C to 70°C
Lead Temperature (Soldering, 10 sec) .....	300°C

					$\pm 0.05$	$\%/Yr$

**Note 1:** Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

**Note 2:** Output voltage is measured immediately after turn-on. Changes due to chip warm-up are typically less than 0.005%.

**Note 3:** Temperature coefficient is measured by dividing the change in output voltage over the temperature range by the change in temperature. Separate tests are done for hot and cold:  $T_{MIN}$  to  $25^{\circ}C$  and  $25^{\circ}C$  to  $T_{MAX}$ .

**Incremental slope is also measured at  $25^{\circ}C$ .** For LT1031BMH, the 5ppm/ $^{\circ}C$  drift specification is for  $-25^{\circ}C$  to  $85^{\circ}C$ . Drift over the full  $-55^{\circ}C$  to  $125^{\circ}C$  range is guaranteed to 7ppm/ $^{\circ}C$ .

**Note 4:** Line and load regulation are measured on a pulse basis. Output changes due to die temperature change must be taken into account separately. Package thermal resistance is  $150^{\circ}C/W$ .

**Note 5:** Shunt mode regulation is measured with the input open. With the input connected, shunt mode current can be reduced to 0mA. Load regulation will remain the same.

**Note 6:** Temperature drift is guaranteed from  $-25^{\circ}C$  to  $85^{\circ}C$  on LH0070.

**Note 7:** See curve for guaranteed minimum  $V_{IN}$  versus  $I_{OUT}$ .

**Note 8:** Guaranteed by design.

## CROSS REFERENCE

The following cross reference guide may be used to select LT1031 grades which meet or exceed output voltage, temperature drift, load and line regulation, and output current specifications of the AD581 reference. Parameters such as noise, hysteresis, and long term stability will be significantly better for all LT1031 grades compared to the AD581.

CROSS REFERENCE GUIDE/LT1031 TO AD581	
AD581J	order LT1031DCH
AD581K	order LT1031CCH
AD581L	order LT1031BCH

## APPLICATIONS INFORMATION

### Trimming Output Voltage

The LT1031 output can be trimmed by driving the ground pin. The suggested method is shown in the illustration below. A 5Ω resistor is inserted in series with the ground pin. The top of the resistor is supplied current from a trim potentiometer. This technique requires fairly high trim current of up to 1.5mA from the LT1031 or 3.5mA from the –15V supply; however it is necessary to maintain low drift in the reference. Ground pin current changes in the LT1031, with temperature, could be as high as 4µA/°C. This, coupled with the 5Ω external resistor, creates up to 2ppm/°C drift in the reference ( $5\Omega \cdot 4\mu\text{A}/^\circ\text{C} = 20\mu\text{V}/^\circ\text{C} = 2\text{ppm}/^\circ\text{C}$ ). If induced drift higher than this can be tolerated, all resistor values in the trim circuit can be raised proportionately to reduce current drain.

\* CAN BE INCREASED TO 5.6k FOR  
LT1031B AND LH0070-2

\*\* INCREASE TO 10Ω FOR LT1031D

LT1031 • TA04

### Effect of Reference Drift on System Accuracy

A large portion of the temperature drift error budget in many systems is the system reference voltage. The graph below indicates the maximum temperature coefficient allowable if the reference is to contribute no more than 1/2LSB error to the overall system performance. The example shown is a 12-bit system designed to operate over a temperature range from 25°C to 65°C. Assuming the system calibration is performed at 25°C, the temperature span is 40°C. The graph shows that the temperature coefficient of the reference must be no worse than 3ppm/°C if it is to contribute less than 1/2LSB error. For this reason, the LT1031 has been optimized for low drift.

## APPLICATIONS INFORMATION

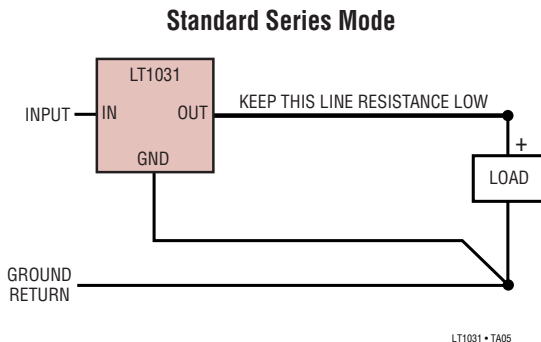

### Capacitive Loading and Transient Response

The LT1031 is stable with all capacitive loads, but for optimum settling with load transients, output capacitance should be under 1000pF. The output stage of the reference is class AB with a fairly low idling current. This makes transient response worst-case at light load currents. Because of internal current drain on the output, actual worst-case occurs at  $I_{LOAD} = 1.4\text{mA}$  (sinking). Significantly better load transient response is obtained by moving slightly away from these points. See Load Transient Response curves for details. In general, best transient response is obtained when the output is sourcing current. In critical applications, a  $10\mu\text{F}$  solid tantalum capacitor with several ohms in series provides optimum output bypass.

### Kelvin Connections

Although the LT1031 does not have true force/sense capability at its outputs, significant improvements in ground loop and line loss problems can be achieved with proper hook-up. In series mode operation, the ground pin of the LT1031 carries only  $\approx 1\text{mA}$  and can be used as a sense line, greatly reducing ground loop and loss problems on the low side of the reference. The high side supplies load current so line resistance must be kept low. Twelve feet of #22 gauge hook up wire or 1 foot of 0.025 inch printed circuit trace will create 2mV loss at 10mA output current. This is equivalent to 1LSB in a 10V, 12-bit system.

The following circuits show proper hook-up to minimize errors due to ground loops and line losses. Losses in the output lead can be greatly reduced by adding a PNP boost transistor if load currents are 5mA or higher. R2 can be added to further reduce current in the output sense lead.

### Series Mode with Boost Transistor

\*OPTIONAL—REDUCES CURRENT IN OUTPUT SENSE LEAD

LT1031 • TA06

### Effects of Air Movement on Low Frequency Noise

The LT1031 has very low noise because of the buried zener used in its design. In the 0.1Hz to 10Hz band, peak-to-peak noise is about 0.5ppm of the DC output. To achieve this low noise, however, care must be taken to shield the reference from ambient air turbulence. Air movement can create noise because of thermoelectric differences between IC package leads (especially kovar lead TO-5) and printed circuit board materials and/or sockets. Power dissipation in the reference, even though it rarely exceeds 20mW, is enough to cause small temperature gradients in the package leads. Variations in thermal resistance, caused by uneven airflow, create differential lead temperatures, thereby causing thermoelectric voltage noise at the output of the reference. The XY plotter trace shown on the following page dramatically illustrates this effect. The first half of the plot was done with the LT1031 shielded from ambient air with a small foam cup. The cup was then removed for the second half of the trace. Ambient in both cases was a lab environment with no excessive air turbulence from air conditioners, opening/closing doors, etc. Removing the foam cup increases the output noise by almost an order of magnitude in the 0.01Hz to 1Hz band! The kovar leads of the TO-5 (H) package are the primary culprit. Alloy 42 and copper lead frames used on dual-in-line packages are not nearly as sensitive to thermally generated noise because they are intrinsically matched.

## APPLICATIONS INFORMATION

There is nothing magical about foam cups—any enclosure which blocks air flow from the reference will do. Smaller enclosures are better since they do not allow the build-up of internally generated air movement. Naturally, heat generating components external to the reference itself should not be included inside the enclosure.
