

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## High-Input Voltage SMPS, Start-up/Linear Regulator

---

---

### Features

- Accepts inputs from 15 to 450V
- Output currents: up to 3.0mA continuous, 30mA peak
- Supply current typically 50 $\mu$ A
- Line regulation typically 0.1mV/V
- Output can be trimmed from 8.0 to 12V
- Output current can be increased to 150mA with external FET

### Applications

- Off-line SMPS startup circuits (pulse loads)
- Low power off-line regulators
- Regulators for noisy inputs

### Description

LR645 is a high-input voltage, low-output current, linear regulator that is available in two versions. A 3-terminal, fixed-output voltage version is available in TO-92, TO-220 and SOT-89 packages, as well as an adjustable voltage version available in an 8-lead SOIC package.

The 3-terminal version of LR645 functions like any other low-voltage, 3-terminal regulator except it allows the use of much higher-input voltages. When used in a Switched-mode Power Supply (SMPS), start-up circuit, LR645 eliminates the need for large power resistors. In this application, current is drawn from the high voltage line only during start-up. Only leakage current flows after start-up, thereby reducing the continuous power dissipation to a few milliwatts.

The adjustable-voltage version allows trimming of the output voltage from 8.0 to 12V. This version can also be connected to an external depletion mode metal-oxide-semiconductor field-effect transistor (MOSFET) for increased output current. When used in conjunction with depletion mode MOSFET DN2540N5, an output current of up to 150mA is achieved.

### WARNING

The LR645 does NOT provide galvanic isolation. When operated from an AC line, potentially lethal voltages can be present on the IC. Adequate means of protecting the end user from such voltages must be provided by the circuit developer.

## 1.0 ELECTRICAL CHARACTERISTICS

### ABSOLUTE MAXIMUM RATINGS

Input Voltage .....	450V
Output voltage.....	15.5V
Operating and storage temperature.....	-55°C to +150°C

**Note:** Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions, above those indicated in the operational listings of this specification, is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

### 1.1 ELECTRICAL SPECIFICATIONS

## 2.0 PIN DESCRIPTION

The locations of the pins are listed in [Package Type](#).

**TABLE 2-1: PIN DESCRIPTION**

Function	Description
VIN	Regulator input. 8 - 450V.
GND	Ground return for all internal circuitry. This pin must be electrically connected to circuit common.
GATE	Output GATE driver for an external N-channel depletion.
TRIM	A voltage divider from $V_{OUT}$ to this pin adjusts the output voltage.
VOUT	Regulator output.
NC	No connection.

## 3.0 FUNCTIONAL DESCRIPTION

### 3.1 SMPS Start-Up Circuit

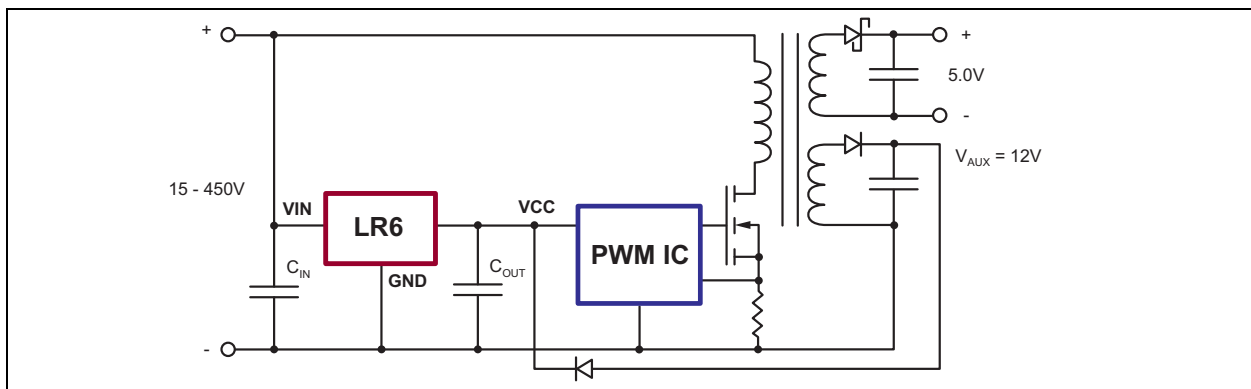

One of the main applications for LR645 is a start-up circuit for off-line, switch-mode power supplies (SMPS), as shown in Figure 3-1. A minimum output capacitance of 10 nF is recommended for stability. The wide operating, input voltage range of LR645 allows the SMPS to operate and start-up from rectified AC, or a DC voltage of 15 to 450V, without adjustment.

During start-up, the LR645 powers the V<sub>CC</sub> line of the Pulse-Width Modulation (PWM) IC with a nominal output voltage of 10V. The auxiliary voltage connected

through a diode to the V<sub>OUT</sub> pin of LR645 will start to increase. When the auxiliary voltage becomes larger than the output voltage LR645 turns OFF both its internal high voltage input line and output voltage, allowing the auxiliary voltage to power the V<sub>CC</sub> line of the PWM IC. After startup, LR645 doesn't draw any input current from the high-voltage line other than the leakage current of the internal MOSFET switch, which is typically 0.1µA.

The 3-terminal version shown in Figure 3-1 has load regulation guaranteed from 0 to 3.0mA at a fixed nominal output voltage of 10V. Applications requiring higher output current and/or a different output voltage can use the 8 pin adjustable version.

**FIGURE 3-1: SMPS START-UP CIRCUIT**

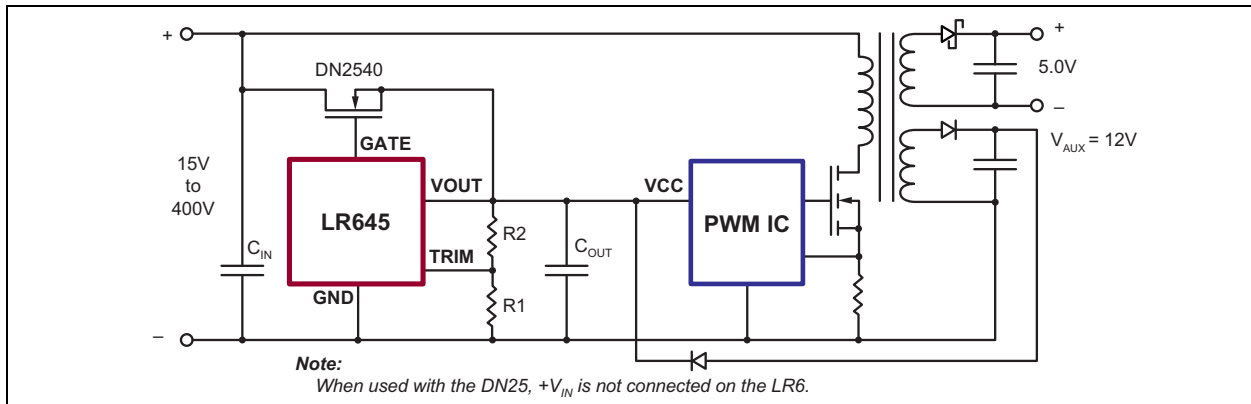

### 3.2 High-Current SMPS Start-Up Circuit

The 8-lead version of LR645 has connections for an external depletion-mode MOSFET for higher-output current and external resistors for adjustable-output voltage. As shown in Figure 3-2, the output current is increased to 150mA by using the DN2540, a 400V depletion-mode MOSFET. The maximum operating input voltage will be limited by the drain-to-source,

breakdown voltage of the external MOSFET, but cannot exceed the 450V rating of LR645.

The output voltage can be adjusted from 8 to 12V with two external resistors: R1 and R2. The ratio of R2/R1 determines the output voltage. R2 is connected between the V<sub>OUT</sub> and TRIM pins; R1 is connected between TRIM and GND pins. Figure 3-3 is a curve showing output voltage versus resistor ratio R2/R1. The optimum range for R1 + R2 is 200KΩ to 300KΩ. This minimizes loading and optimizes accuracy of the output voltage. Figure 3-3 uses an R1 + R2 of 250KΩ.

**FIGURE 3-2: HIGH-CURRENT SMPS START-UP CIRCUIT**

# LR645

**FIGURE 3-3: TYPICAL OUTPUT VOLTAGE VS RESISTOR RATIO**

### 3.3 Off Line Linear Regulator

Circuits that require low voltages to operate logic and analog circuits benefit from LR645. The conventional use of step-down transformers can be eliminated, thereby saving space and cost. Some examples of low-voltage applications are: proximity controlled light switches, street lamp controls, and low-voltage power supplies for appliances such as washing machines, dishwashers, and refrigerators.

The wide operating-input voltage range of 15 to 450V, as well as the ripple rejection ratio of 50dB minimum, allows the use of a small, high-voltage input capacitor. The input AC line can be either full-wave or half-wave rectified. A minimum output capacitance of 0.01μF is recommended for output stability.

**FIGURE 3-5: HIGH-CURRENT REGULATION**

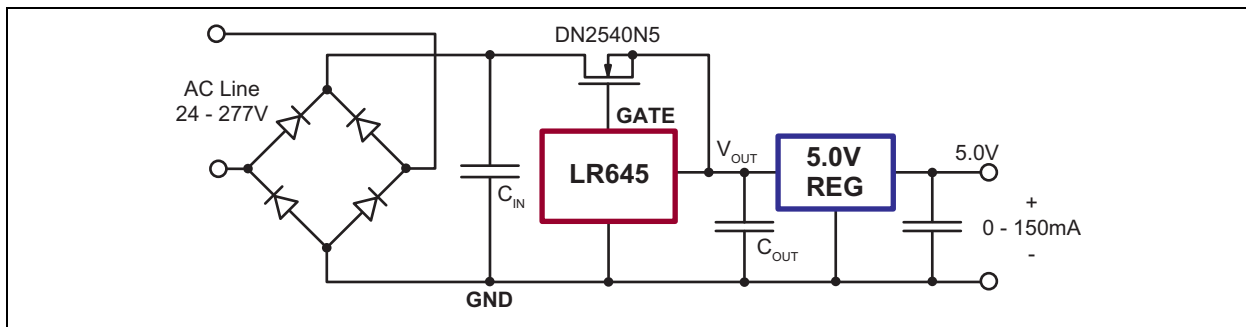

Figure 3-4 shows the LR645 as a pre-regulator to a precision regulator for high precision regulation. Higher output current is also possible by using an external depletion-mode MOSFET DN2540N5 as shown in Figure 3-5.

**FIGURE 3-4: CASCADING FOR PRECISION**

### 3.4 Power Dissipation Considerations

LR645 is a true linear regulator. Its power dissipation is therefore a function of input voltage and output load current. For example, if the LR645 provides a continuous load current of 3mA at 10V, while its input voltage is 400V, total dissipation in the LR645 will be:

$$\begin{aligned}
 P_{DISS} &= (V_{IN} - V_{OUT}) \times (I_{OUT} + I_{MAXQuiescent}) \\
 &= (400V - 10V) \times (3.0mA + 150\mu A) \\
 &= 1.23Watts
 \end{aligned}$$

The 1.23 watts is for continuous operation. This is within the dissipation capabilities of the TO-220 and SOT-89 packages. See Table 1-2 on Page 3 for deratings. For SMPS start-up applications, the output current is usually required only during start-up. This duration depends upon the auxiliary supply output capacitor and C<sub>OUT</sub>, but is typically a few hundred milliseconds. All package types of the LR645 have been characterized for use with a C<sub>OUT</sub> of at least 10μF, and an AC line of 277V.

---

**Note the following details of the code protection feature on Microchip devices:**

- Microchip products meet the specification contained in their particular Microchip Data Sheet.
- Microchip believes that its family of products is one of the most secure families of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the Microchip products in a manner outside the operating specifications contained in Microchip's Data Sheets. Most likely, the person doing so is engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable.”

Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our products. Attempts to break Microchip's code protection feature may be a violation of the Digital Millennium Copyright Act. If such acts allow unauthorized access to your software or other copyrighted work, you may have a right to sue for relief under that Act.
