

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

iNEMO inertial module: always-on 3D accelerometer and 3D gyroscope

Datasheet - production data

Features

- Power consumption: 0.85 mA in combo normal mode and 1.1 mA in combo high-performance mode up to 1.6 kHz.
- “Always-on” experience with low power consumption for both accelerometer and gyroscope
- Interface flexibility: selectable SPI (3/4-wire) or I²C with the main processor
- Auxiliary SPI (3-wire) to support OIS applications
- EIS/OIS support
- Accelerometer ODR up to 6.66 kHz
- Gyroscope ODR up to 3.33 kHz
- Smart FIFO
- $\pm 2/\pm 4/\pm 8/\pm 16$ g full scale
- $\pm 125/\pm 245/\pm 500/\pm 1000/\pm 2000$ dps full scale
- Analog supply voltage: 1.71 V to 3.6 V
- Independent IOs supply (1.62 V)
- Compact footprint, 2.5 mm x 3 mm x 0.83 mm
- SPI/I²C serial interface data synchronization feature
- Embedded temperature sensor
- ECOPACK[®], RoHS and “Green” compliant

Applications

- EIS and OIS for camera applications
- Collecting sensor data
- Motion tracking and gesture detection
- Pedometer, step detector and step counter
- Significant motion and tilt functions
- Indoor navigation
- IoT and connected devices
- Vibration monitoring and compensation

Description

The LSM6DS3US is a system-in-package featuring a 3D digital accelerometer and a 3D digital gyroscope performing at 1.1 mA (up to 1.6 kHz ODR) in high-performance mode and enabling always-on low-power features for an optimal motion experience for the consumer.

The LSM6DS3US supports main OS requirements, offering real, virtual and batch sensors with 4 kbyte FIFO + flexible 4 kbyte (FIFO or programmable) for dynamic data batching.

The LSM6DS3US gyroscope supports both OIS/EIS applications. The device can be connected to the camera module through a dedicated auxiliary SPI (Mode 3) while flexibility for the primary interface is available (I²C/SPI).

ST’s family of MEMS sensor modules leverages the robust and mature manufacturing processes already used for the production of micromachined accelerometers and gyroscopes.

The various sensing elements are manufactured using specialized micromachining processes, while the IC interfaces are developed using CMOS technology that allows the design of a dedicated circuit which is trimmed to better match the characteristics of the sensing element.

The LSM6DS3US has a full-scale acceleration range of $\pm 2/\pm 4/\pm 8/\pm 16$ g and an angular rate range of $\pm 125/\pm 245/\pm 500/\pm 1000/\pm 2000$ dps.

High robustness to mechanical shock makes the LSM6DS3US the preferred choice of system designers for the creation and manufacturing of reliable products.

The LSM6DS3US is available in a plastic land grid array (LGA) package.

1 Overview

The LSM6DS3US is a system-in-package featuring a high-performance 3-axis digital accelerometer and 3-axis digital gyroscope.

The integrated power-efficient modes are able to reduce the power consumption down to 1.1 mA in high-performance mode, combining always-on low-power features with superior sensing precision for an optimal motion experience for the consumer thanks to ultra-low noise performance for both the gyroscope and accelerometer.

The LSM6DS3US delivers best-in-class motion sensing that can detect orientation and gestures in order to empower application developers and consumers with features and capabilities that are more sophisticated than simply orienting their devices to portrait and landscape mode.

The event-detection interrupts enable efficient and reliable motion tracking and contextual awareness, implementing hardware recognition of free-fall events, 6D orientation, tap and double-tap sensing, activity or inactivity, and wakeup events.

The LSM6DS3US supports main OS requirements, offering real, virtual and batch mode sensors. In addition, the LSM6DS3US can efficiently run the sensor-related features specified in Android, saving power and enabling faster reaction time. In particular, the LSM6DS3US has been designed to implement hardware features such as significant motion, tilt, pedometer functions, timestamping and to support the data acquisition of an external magnetometer with ironing correction (hard, soft).

The LSM6DS3US offers hardware flexibility to connect the pins with different mode connections to external sensors to expand functionalities such as adding a sensor hub, auxiliary SPI, etc. The application processor connection is supported by both SPI and I²C interfaces for complete interface flexibility.

Up to 8 kbyte of FIFO [4 kbyte FIFO + flexible 4 kbyte (FIFO or programmable)] with dynamic allocation of significant data (i.e. external sensors, timestamp, etc.) allows overall power saving of the system.

Like the entire portfolio of MEMS sensor modules, the LSM6DS3US leverages the robust and mature in-house manufacturing processes already used for the production of micromachined accelerometers and gyroscopes. The various sensing elements are manufactured using specialized micromachining processes, while the IC interfaces are developed using CMOS technology that allows the design of a dedicated circuit which is trimmed to better match the characteristics of the sensing element.

The LSM6DS3US is available in a small plastic land grid array (LGA) package of 2.5 x 3.0 x 0.83 mm to address ultra-compact solutions.

2 Embedded low-power features

The LSM6DS3US has been designed to be fully compliant with Android, featuring the following on-chip functions:

- 8 kbyte data buffering
 - 4 kbyte FIFO + flexible 4 kbyte (FIFO or programmable)
 - 100% efficiency with flexible configurations and partitioning
 - possibility to store timestamp
- Event-detection interrupts (fully configurable):
 - free-fall
 - wakeup
 - 6D orientation
 - tap and double-tap sensing
 - activity / inactivity recognition
- Specific IP blocks with negligible power consumption and high-performance:
 - pedometer functions: step detector and step counters
 - tilt (Android compliant, refer to [Section 2.1: Tilt detection](#) for additional info)
 - significant motion (Android compliant)
- Sensor hub
 - up to 6 total sensors: 2 internal (accelerometer and gyroscope) and 4 external sensors
- Data rate synchronization with external trigger for reduced sensor access and enhanced fusion

2.1 Tilt detection

The tilt function helps to detect activity change and has been implemented in hardware using only the accelerometer to achieve both the targets of ultra-low power consumption and robustness during the short duration of dynamic accelerations.

It is based on a trigger of an event each time the device's tilt changes by an angle greater than 35 degrees from the start position.

The tilt function can be used with different scenarios, for example:

- a) Trigger when phone is in a front pants pocket and the user goes from sitting to standing or standing to sitting;
- b) Doesn't trigger when phone is in a front pants pocket and the user is walking, running or going upstairs.

3 Pin description

Figure 1. Pin connections

3.1 Pin connections

The LSM6DS3US offers the flexibility to connect the pins in order to have three different mode connections and functionalities. In detail:

- **Mode 1:** I²C slave interface or SPI (3- and 4-wire) serial interface is available;
- **Mode 2:** I²C slave interface or SPI (3- and 4-wire) serial interface and I²C interface master for external sensors connections are available;
- **Mode 3^(a):** I²C slave interface or SPI (3- and 4-wire) serial interface is available for the application processor interface while an auxiliary SPI (3-wire) serial interface for external sensor connections (i.e. camera module) is available.

Figure 2. LSM6DS3US connection modes

In the following table each mode is described for the pin connection and function.

a. In the primary SPI connection, the gyroscope output data is available in registers 22h to 27h with user-selected FS and ODR. In the auxiliary SPI connection, gyroscope output data is available in registers 22h to 27h @ 3.3 kHz and FS = 250 dps.

1. Typical specifications are not guaranteed.
2. Linear acceleration sensitivity after factory calibration test and trimming.
3. Angular rate sensitivity after factory calibration test and trimming.
4. Values after soldering.
5. RND (rate noise density) mode is independent of the ODR and FS setting.

6. Gyro noise RMS is independent of the ODR and FS setting.
7. Noise density in HP mode is the same for all ODRs.
8. Noise RMS in Normal/LP mode is the same for all the ODR RMS related to $BW = ODR / 2$ (for ODR /9, typ value can be calculated by $Typ * 0.6$)
9. To enable this ODR, refer to [CTRL4_C \(13h\)](#).
10. The sign of the linear acceleration self-test output change is defined by the STx_XL bits in [CTRL5_C \(14h\)](#), [Table 60](#) for all the axes.
11. The linear acceleration self-test output change is defined with the device in stationary condition as the absolute value of: $OUTPUT[LSb] \text{ (self-test enabled)} - OUTPUT[LSb] \text{ (self-test disabled)}$. 1LSb = 0.061 mg at $\pm 2 g$ full scale.
12. The sign of the angular rate self-test output change is defined by the STx_G bits in [CTRL5_C \(14h\)](#), [Table 59](#) for all the axes.
13. The angular rate self-test output change is defined with the device in stationary condition as the absolute value of: $OUTPUT[LSb] \text{ (self-test enabled)} - OUTPUT[LSb] \text{ (self-test disabled)}$. 1LSb = 70 mdps at ± 2000 dps full scale.
