## : ©hipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation, and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

- Up to 10MHz Center Frequency on a Single 3V Supply
- Easy to Use-A Single Resistor Value Sets Lowpass Cutoff Frequency ( $200 \mathrm{kHz} \leq f_{c} \leq 5 \mathrm{MHz}$ ), Unequal Resistor Values Extend Cutoff Frequency Up to 10MHz
- Extremely Flexible—Different Resistor Values Allow Lowpass Transfer Functions with or Without Gain (Butterworth, Chebyshev or Custom)
- SNR = 92dB ( $f \mathrm{C}=2 \mathrm{MHz}, 2 \mathrm{~V}_{\mathrm{P}-\mathrm{P}}$ )
- THD $=-84 \mathrm{~dB}\left(f_{\mathrm{C}}=2 \mathrm{MHz}, 1 \mathrm{~V}_{\mathrm{P}-\mathrm{P}}\right)$
- Internal Capacitors Trimmed to $\pm 0.75 \%$
- Single 4-Pole Lowpass Filter or Matched Pair of 2-Pole Lowpass Filters
- Can be Connected as a Bandpass Filter
- Single-Ended or Differential Output
- Operates from Single 3V (2.7V Min) to $\pm 5 \mathrm{~V}$ Supply
- Rail-to-Rail Input and Output Voltages

## APPLICATIONS

- Replaces Discrete RC Active Filters and LC Filter Modules
- Antialiasing/Reconstruction Filters
- Dual or I-and-Q Channels (Two Matched 2nd Order Filters in One Package)
- Single-Ended to Differential Conversion
- Video Signal Processing

## FEATURES

 <br> \title{
## Very Low Noise, <br> \title{ \section*{Very Low Noise, High Frequency Active RC, High Frequency Active RC, Filter Building Block Filter Building Block DESCRIPTIOn} 

 DESCRIPTIOn}}

The $\mathrm{LT}^{\circledR} 1568$ is an easy-to-use, active-RC filter building block with rail-to-rail inputs and outputs. The internal capacitors of the IC and the GBW product of the internal low noise op amps are trimmed such that consistent and repeatable filter responses can be achieved. With a single resistor value, the LT1568 provides a pair of matched 2-pole Butterworth lowpass filters with unity gain suitable for I/Q channels.

By using unequal-valued external resistors, the two 2-pole sections can create different frequency responses or gains. In addition, the two stages may be cascaded to create a single 4-pole filter with a programmable response. Capable of cutoff frequencies up to 10 MHz , the LT1568 is ideal for antialiasing or channel filtering in high speed data communications systems. The LT1568 can also be used as a bandpass filter.

The LT1568 features very low noise, supporting signal-tonoise ratios of over 90 dB . It also provides single-ended to differential signal conversion for directly driving high speed A/D converters. The LT1568 has a shutdown mode that reduces supply current to approximately 0.5 mA on a 5 V supply.
The LT1568 is available in a narrow 16-lead SSOP package.
$\boldsymbol{\triangle}$, LTC and LT are registered trademarks of Linear Technology Corporation.

## TYPICAL APPLICATION

Amplitude and Phase Matched Dual Butterworth 2.5MHz Lowpass Filter with Differential Output. Single 3V Supply Operation

## ABSOLUTE MAXIMUM RATINGS

(Note 1)
Total Supply Voltage ( $\mathrm{V}^{+}$to $\mathrm{V}^{-}$) ........................... 11.6V
Input Voltage on INVA, INVB, GNDA and
GNDB Pins. $\qquad$ $\mathrm{V}^{+}$to $\mathrm{V}^{-}$
Input Current on INVA, INVB, GNDA and GNDB Pins (Note 2) $\qquad$ $\pm 10 \mathrm{~mA}$
Output Short-Circuit Duration on OUTA, OUTB, OUTA and OUTB Pins $\qquad$ Indefinite
Maximum Continuous Output Current (Note 3) DC $\pm 100 \mathrm{~mA}$
Specified Temperature Range (Note 9)
LT1568C $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ LT15681 ............................................ $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$
Junction Temperature $150^{\circ} \mathrm{C}$
Storage Temperature Range ................ $-65^{\circ} \mathrm{C}$ to $150^{\circ} \mathrm{C}$ Lead Temperature (Soldering, 10 sec )................. $300^{\circ} \mathrm{C}$

PACKAGE/ORDER INFORMATION

Consult LTC Marketing for parts specified with wider operating temperature ranges.

|  |  | $\begin{aligned} & \mathrm{f}_{\mathrm{C}}=10 \mathrm{MHz}, \mathrm{R}_{\text {FIL }}=128 \Omega, \\ & \mathrm{f}_{\text {IN }}=2 \mathrm{MHz}, V_{\text {IIN }}=1 \mathrm{~V}_{\text {P-P }} \end{aligned}$ |  |  | -69 |  | dB |

Note 1: Absolute Maximum Ratings are those values beyond which the life of the device may be impaired.
Note 2: The inputs of each op amp are protected by back-to-back diodes. If either differential input voltage exceeds 1.4 V , the input current should be limited to less than 10 mA .
Note 3: A heat sink may be required to keep the junction temperature below the absolute maximum rating when the output is shorted indefinitely.
Note 4: The inverter bandwidth is measured with the SA or SB output floating, and is defined as the frequency at which the phase shift from OUTA (OUTB) to OUTA (OUTB) drops from $180^{\circ}$ to $135^{\circ}$.
Note 5: Measured with the SA or SB output connected in the filter application circuit as shown in the Block Diagram.
Note 6: The common mode input voltage range is measured by shorting the filter input to the common mode reference (GNDA or GNDB) and applying a $D C$ input voltage to search for the common mode voltage range that creates a $\pm 2 \mathrm{mV}\left(\mathrm{V}_{S}=3 \mathrm{~V}\right)$ or $\pm 5 \mathrm{mV}\left(\mathrm{V}_{\mathrm{S}}= \pm 5 \mathrm{~V}\right)$ change in the (OUTA or OUTB) voltage (measured with respect to GNDA or GNDB).

Note 7: The minimum cutoff frequency of the LT1568 is arbitrarily listed as 200 kHz . The limit is arrived at by setting the maximum resistor value limit at 6.4 k . Due to input bias current, the output DC offset through a single section can be as high as 25 mV with resistors this large. The LT1568 can be used with even larger resistors if the large offset voltages can be tolerated. For cutoff frequencies below 200 kHz , refer to the LTC1563-2, LTC1563-3.
Note 8: With equal-sized resistors, the differential DC gain through either a single section or cascaded sections is 6 dB .
Note 9: The LT1568C is guaranteed to meet specified performance from $0^{\circ} \mathrm{C}$ to $70^{\circ} \mathrm{C}$. The LT1568C is designed, characterized and expected to meet specified performance from $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ but is not tested or QA sampled at these temperatures. The LT15681 is guaranteed to meet specified performance from $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$.

## PIn functions

$\mathrm{V}^{+}$(Pins 1, 16): The $\mathrm{V}^{+}$positive supply voltage pins should be tied together and bypassed with a $0.1 \mu \mathrm{~F}$ capacitor to an adequate analog ground plane using the shortest possible wiring.
INVA, INVB (Pins 2, 15): Inverting Input. Each of the INV pins is an inverting input of an op amp. Note that the INV pins are high impedance, and are susceptible to coupling of unintended signals. External parasitic capacitance on the INV nodes will also affect the frequency response of the filter sections. For these reasons, printed circuit connections to the INV pins must be kept as short as possible.

SA, SB (Pins 3, 14): Summing Pins. These pins are a summing junction for input signals. Stray capacitance on the SA or SB pins may cause "small" frequency errors of the frequency response near the cutoff frequency (or center frequency). The three external resistors for each section should be located as close as possible to the SA or SB pin to minimize stray capacitance (one picofarad of stray capacitance may add up to $0.1 \%$ frequency error).

## OUTA, OUTB (Pins 4, 13): Lowpass Output. These pins

 are the rail-to-rail outputs of op amps. Each output is designed to drive a nominal net load of $400 \Omega$ and 30 pF .$\overline{\text { OUTA }}, \overline{\text { OUTB }}$ (Pins 5, 12): These pins are the inverted versions of the OUTA and OUTB outputs respectively. Each output is designed to drive a nominal load of $400 \Omega$ and 30pF.

GNDA (Pin 6): GNDA serves as the common mode reference voltage for section A. It should be tied to the analog ground plane in a dual supply system. In a single-supply system, an internal resistor divider can be used to establish a half-supply reference point. In that case, GNDA must be bypassed to $\mathrm{V}^{-}($Pins 8,9$)$ by a $0.1 \mu \mathrm{~F}$ capacitor.

NC (Pin 7): This pin is not connected internally and can be connected to ground.
$\mathrm{V}^{-}$(Pins 8, 9): The $\mathrm{V}^{-}$negative supply voltage pins should be tied together and bypassed to GND by a $0.1 \mu \mathrm{~F}$ capacitor in a dual-supply system. In a single-supply system, tie these pins to the ground plane.
$\overline{\mathrm{EN}}$ (Pin 10): ENABLE. When the $\overline{\mathrm{EN}}$ input goes high or is open circuited, the LT1568 enters a shutdown state which reduces the supply current to approximately 0.5 mA $\left(\mathrm{V}_{S}=5 \mathrm{~V}\right)$. The OUTA, OUTB, OUTA and OUTB pins assume high impedance states. GNDA will continue to be biased at half-supply. If an input signal is applied to a complete filter circuit while the LT1568 is in shutdown, some signal will normally flow to the output through passive components around the inactive IC.

EN is connected to $\mathrm{V}^{+}$through an internal pull-up resistor of approximately 40k. This defaults the LT1568 to the shutdown state if the EN pin is left floating. Therefore, the user must connect the EN pin to a voltage equal to or less than $\left(V^{+}-2.1\right) V$ to enable the part for normal operation. (For example, if $\mathrm{V}^{+}$is 5 V , then to enable the part the EN pin voltage should be 2.9 V or less.)
GNDB (Pin 11): GNDB serves as the common mode reference voltage for section B. It should be tied to the analog ground plane in a dual supply system. In a singlesupply system, GNDB can be tied to GNDA to set the common mode voltage at half-supply. If it is tied to another reference voltage, GNDB should be bypassed to $\mathrm{V}^{-}$(Pins 8,9 ) by a $0.1 \mu \mathrm{~F}$ capacitor.

Single Supply Power and Ground Connections

## BLOCK DIAGRAM AnD TEST CIRCUIT

## APPLICATIONS INFORMATION

The LT1568 has been designed to make the implementation of high frequency filtering functions very easy. Internal low noise amplifiers and capacitors are configured in a topology that requires only three external resistors to implement a 2nd order filter stage. The two 2nd order stages can be used independently or cascaded for simple 4th order filter functions. With two stages integrated on the same die, the matching of the independent sections is better than what can be achieved with separate amplifier components.

## OPERATING WITH SINGLE OR DUAL SUPPLIES

Figure 1 shows the recommended connection of an analog ground plane with the LT1568 biased from either symmetrical dual $( \pm \mathrm{V})$ power supplies or a single supply. Connection of the two GND pins is important to properly DC bias the internal amplifiers. The use of a ground plane helps to minimize noise and stray components to preserve signal integrity and maintain frequency response accuracy.
When biasing from a dual supply, it is recommended that a Schottky diode clamp (BAT54S) be added as shown. These diodes ensure that improper supply voltages, through either reverse polarity or power-up sequencing, do not damage the LT1568.

## Dual Supply Power and Ground Connections

## SIMPLE FILTER IMPLEMENTATIONS

The basic 2nd order filter block of the LT1568, with three external resistors connected as shown in the Block Diagram, has the following lowpass transfer function:

$$
\frac{e_{\mathrm{OUT}}}{\mathrm{e}_{\mathrm{IN}}}=-\frac{D C_{\mathrm{GAIN}} \bullet\left(2 \pi f_{0}\right)^{2}}{s^{2}+\frac{2 \pi f_{0}}{Q} s+\left(2 \pi f_{0}\right)^{2}}
$$

where $\mathrm{e}_{\text {OUT }}$ is either OUTA or OUTB,

$$
\mathrm{DC}_{\mathrm{GAIN}}=\frac{\mathrm{R} 2}{\mathrm{R} 1}, \mathrm{f}_{0}=\frac{1}{2 \pi \sqrt{\mathrm{R} 2 \cdot \mathrm{R} 3 \cdot \mathrm{C} 1 \cdot \mathrm{C} 2}}
$$

and

$$
\mathrm{Q}=\frac{2 \pi \cdot \mathrm{C} 1 \cdot \mathrm{C} 2 \cdot \mathrm{R} 1 \cdot \mathrm{R} 2 \cdot \mathrm{R} 3 \cdot \mathrm{f}_{0}}{\mathrm{C} 1 \cdot[\mathrm{R} 1 \cdot(\mathrm{R} 2+\mathrm{R} 3)+\mathrm{R} 2 \cdot \mathrm{R} 3]-\mathrm{C} 2 \cdot \mathrm{R} 1 \cdot \mathrm{R} 2}
$$

The typical values of the internal capacitors are:

$$
\begin{aligned}
& C 1=105.7 \mathrm{pF} \\
& C 2=141.3 \mathrm{pF}
\end{aligned}
$$

These filter functions assume ideal amplifiers.

## Single Supply Power and Ground Connections

Figure 1. Dual and Single Supply and Ground Plane Connections

## APPLICATIONS InFORMATION

The following filter examples are provided to make it easy to design a variety of filter stages. Both 2nd and 4th order filters are shown. For each filer, a table of external resistor values (standard 1\% tolerance) is provided. These resistor values have been adjusted to compensate for the finite gain bandwidth product of the LT1568 amplifiers.
To implement a filter, simply connect the resistor values shown in the table for the cutoff frequency desired. If the desired cutoff frequency is not shown in the table of values, use interpolation as recommended in the next section.

## DESIGNING FOR ANY CUTOFF FREQUENCY

To implement a lowpass filter with a cutoff frequency not included in the design table, resistor values can be interpolated in the following manner:

## For a Cutoff Frequency, $\mathrm{f}_{\mathrm{C}}$, Less Than 1 MHz

Start with the resistor values for $\mathrm{f}_{\mathrm{C}}=1 \mathrm{MHz}$ and then scale them up by the ratio of $\left(1 \mathrm{MHz} / \mathrm{f}_{\mathrm{C}}\right)$.

Example: Implement a 2nd order Iowpass Chebyshev filter with an $\mathrm{f}_{\mathrm{C}}$ of 256 kHz . From Table 2 the values for $\mathrm{f}_{\mathrm{C}}$ of 1 MHz are $\mathrm{R} 11=\mathrm{R} 21=976 \Omega$ and $\mathrm{R} 31825 \Omega$.

Scaling for $\mathrm{f}_{\mathrm{C}}=256 \mathrm{kHz}$ :

$$
\begin{aligned}
& \mathrm{R} 11=\mathrm{R} 21=976 \Omega \bullet(1 \mathrm{MHz} / 256 \mathrm{kHz}) \approx 3.83 \mathrm{k} \\
& \mathrm{R} 31=825 \Omega \bullet(1 \mathrm{MHz} / 256 \mathrm{kHz}) \approx 3.24 \mathrm{k}
\end{aligned}
$$

## For a Cutoff Frequency, $\mathrm{f}_{\mathrm{C}}$, Between Values Given in a Design Table

Start with the resistor values for the cutoff frequency closest to the desired one and scale the values up or down accordingly.
Example: Implement a 2nd order Iowpass Chebyshev filter with an $\mathrm{f}_{\mathrm{C}}$ of 3.2 MHz . From Table 2 the closest values are forf $f_{c}$ of 3 MHz and are $\mathrm{R} 11=\mathrm{R} 21=316 \Omega$ and $\mathrm{R} 31=274 \Omega$.
Scaling for $\mathrm{f}_{\mathrm{C}}=3.2 \mathrm{MHz}$ :

$$
\begin{aligned}
& \mathrm{R} 11=\mathrm{R} 21=316 \Omega \cdot(3 \mathrm{MHz} / 3.2 \mathrm{MHz}) \approx 294 \Omega \\
& \mathrm{R} 31=274 \Omega \cdot(3 \mathrm{MHz} / 3.2 \mathrm{MHz}) \approx 255 \Omega
\end{aligned}
$$

## DUAL 2nd ORDER LOWPASS FITEER DESIGNS

Table 2. Resistor Values in Ohms, Dual 2nd Order Lowpass Chebyshev, $\pm 0.25 \mathrm{~dB}$ Passband Ripple, Gain $=1, \mathrm{R} 11=\mathrm{R} 12$, R21 = R22, R31 = R32

| $\mathbf{f}_{\text {CuTOFF }}(\mathbf{M H z})$ | R11, R21 | R31 |
| :---: | :---: | :---: |
| 1 | $976 \Omega$ | $825 \Omega$ |
| 2 | $475 \Omega$ | $412 \Omega$ |
| 3 | $316 \Omega$ | $274 \Omega$ |
| 4 | $226 \Omega$ | $205 \Omega$ |
| 5 | $178 \Omega$ | $165 \Omega$ |
| 6 | $143 \Omega$ | $137 \Omega$ |
| 7 | $121 \Omega$ | $118 \Omega$ |

Amplitude Response 2nd Order Lowpass Chebyshev, $\pm 0.25 \mathrm{~dB}$ Passband Ripple, $\mathrm{f}_{\text {Cutoff }}=1 \mathrm{MHz}$

Transient Response 2nd Order Lowpass Chebyshev, $\pm 0.25 \mathrm{~dB}$ Passband Ripple, fcutoff $=1 \mathrm{MHz}$

Table 3. Resistor Values in Ohms, Dual 2nd Order Lowpass
Bessel, Gain = 1

| f Cutoff (MHz) | R11, R21 | R31 |
| :---: | :---: | :---: |
| 1 | $866 \Omega$ | $1180 \Omega$ |
| 2 | $422 \Omega$ | $590 \Omega$ |
| 3 | $280 \Omega$ | $383 \Omega$ |
| 4 | $210 \Omega$ | $287 \Omega$ |
| 5 | $165 \Omega$ | $232 \Omega$ |
| 6 | $137 \Omega$ | $191 \Omega$ |
| 7 | $115 \Omega$ | $162 \Omega$ |

Amplitude Response
2nd Order Lowpass Bessel, $\mathrm{f}_{\text {Cutoff }}=1 \mathrm{MHz}$

Transient Response
2nd Order Lowpass Bessel, $\mathrm{f}_{\text {Cutoff }}=1 \mathrm{MHz}$

## 4th ORDER LOWPASS FILTER DESIGNS

4th Order Lowpass Filter, Dual Supply Operation

4th Order Lowpass Filter, Single Supply Operation

Table 4. Resistor Values in Ohms, 4th Order Lowpass
Butterworth, Gain = 1

| $\mathbf{f}_{\text {CUTOFF }}$ (MHz) | R11, R21 | R31 | R12, R22 | R32 |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 1.05 k | 1.58 k | 1.82 k | $887 \Omega$ |
| 2 | $523 \Omega$ | $787 \Omega$ | $909 \Omega$ | $432 \Omega$ |
| 3 | $348 \Omega$ | $523 \Omega$ | $590 \Omega$ | $294 \Omega$ |
| 4 | $255 \Omega$ | $383 \Omega$ | $432 \Omega$ | $215 \Omega$ |
| 5 | $205 \Omega$ | $309 \Omega$ | $348 \Omega$ | $174 \Omega$ |
| 6 | $169 \Omega$ | $255 \Omega$ | $280 \Omega$ | $143 \Omega$ |
| 7 | $143 \Omega$ | $221 \Omega$ | $232 \Omega$ | $124 \Omega$ |
| 8 | $124 \Omega$ | $196 \Omega$ | $196 \Omega$ | $107 \Omega$ |
| 9 | $107 \Omega$ | $174 \Omega$ | $169 \Omega$ | $97.6 \Omega$ |
| 10 | $97.6 \Omega$ | $158 \Omega$ | $143 \Omega$ | $88.7 \Omega$ |

Amplitude Response
4th Order Lowpass Butterworth Lowpass, $\mathrm{f}_{\text {Cutoff }}=1 \mathrm{MHz}$

Transient Response 4th Order Lowpass Butterworth Lowpass, $\mathrm{f}_{\text {Cutoff }}=1 \mathrm{MHz}$

$1 \mu \mathrm{~s} / \mathrm{DIV}$

## 4th ORDER LOWPASS FILTER DESIGNS

Table 5. Resistor Values in Ohms, 4th Order Lowpass
Chebyshev, $\pm 0.25 \mathrm{~dB}$ Passband Ripple, Gain $=1$

| f Cut0FF (MHz) | R11, R21 | R31 | R12, R22 | R32 |
| :---: | :---: | :---: | :---: | :---: |
| 1 | 1.87 k | 2.05 k | 2.21 k | $634 \Omega$ |
| 2 | $931 \Omega$ | 1.05 k | 1.10 k | $324 \Omega$ |
| 3 | $604 \Omega$ | $681 \Omega$ | $698 \Omega$ | $205 \Omega$ |
| 4 | $453 \Omega$ | $511 \Omega$ | $499 \Omega$ | $154 \Omega$ |
| 5 | $357 \Omega$ | $402 \Omega$ | $383 \Omega$ | $121 \Omega$ |
| 6 | $287 \Omega$ | $332 \Omega$ | $309 \Omega$ | $100 \Omega$ |
| 7 | $243 \Omega$ | $287 \Omega$ | $255 \Omega$ | $86.6 \Omega$ |
| 8 | $205 \Omega$ | $249 \Omega$ | $215 \Omega$ | $76.8 \Omega$ |
| 9 | $178 \Omega$ | $221 \Omega$ | $182 \Omega$ | $66.5 \Omega$ |
| 10 | $154 \Omega$ | $196 \Omega$ | $158 \Omega$ | $61.9 \Omega$ |

Amplitude Response 4th Order Lowpass Chebyshev, $\pm 0.25 \mathrm{~dB}$ Passband Ripple, $\mathrm{f}_{\text {cutoff }}=1 \mathrm{MHz}$

Transient Response 4th Order Lowpass Chebyshev, $\pm 0.25 \mathrm{~dB}$ Passband Ripple, $\mathrm{f}_{\text {Cutoff }}=1 \mathrm{MHz}$

Table 6. Resistor Values in Ohms, 4th Order Lowpass Bessel, Gain $=1$

| $\mathbf{f}_{\text {CUTOFF }}(\mathbf{M H z )}$ | R11, R21 | R31 | R12, R22 | R32 |
| :---: | :---: | :---: | :---: | :---: |
| 1 | $715 \Omega$ | 1.15 k | 1.91 k | $324 \Omega$ |
| 2 | $357 \Omega$ | $562 \Omega$ | $432 \Omega$ | $365 \Omega$ |
| 3 | $237 \Omega$ | $374 \Omega$ | $280 \Omega$ | $243 \Omega$ |
| 4 | $174 \Omega$ | $280 \Omega$ | $205 \Omega$ | $187 \Omega$ |
| 5 | $137 \Omega$ | $221 \Omega$ | $162 \Omega$ | $147 \Omega$ |
| 6 | $115 \Omega$ | $187 \Omega$ | $130 \Omega$ | $124 \Omega$ |

Amplitude Response
4th Order Lowpass Bessel, $\mathrm{f}_{\text {cutoff }}=1 \mathrm{MHz}$

Transient Response 4th Order Lowpass Bessel, flcutoff $=1 \mathrm{MHz}$

## LT1568

## TYPICAL APPLICATIONS

4th Order Bandpass Filter
$\mathrm{f}_{\text {CENTER }}=10 \mathrm{MHz},-3 \mathrm{~dB}$ Passband $=\mathrm{f}_{\text {CENTER }} / 5.4$

Amplitude Response 4th Order Bandpass Filter f CENTER $=10 \mathrm{MHz}$

## PACKAGE DESCRIPTION

GN Package
16-Lead Plastic SSOP (Narrow . 150 Inch)
(Reference LTC DWG \# 05-08-1641)

**DIMENSION DOES NOT INCLUDE INTERLEAD FLASH. INTERLEAD
FLASH SHALL NOT EXCEED 0.010 " ( 0.254 mm ) PER SIDE

## RELATED PARTS

| PART NUMBER | DESCRIPTION | COMMENTS |
| :--- | :--- | :--- |
| LTC ${ }^{\oplus} 1563$ | 4th Order Filter Building Block | Lowpass or Bandpass Filter Designs, 256Hz to 256kHz |
| LTC1565-31 | 7th Order, Fully Differential 650kHz Lowpass Filter | SO-8, No External Components |
| LTC1566-1 | 7th Order, Fully Differential 2.3MHz Lowpass Filter | SO-8, No External Components |
| LT1567 | Very Low Noise Op Amp and Inverter | $1.4 \mathrm{nV} / \sqrt{\mathrm{Hz}}$ Op Amp, MSOP Package, Differential Outputs |
| LT6600-10 | Fully Differential 10MHz Lowpass Filter | $55 \mu \mathrm{~V}_{\text {RMS }}$ Noise 100kHz to 10MHz, Operates with 3V Supply |
| LT6600-20 | Fully Differential 20MHz Lowpass Filter | $86 \mu \mathrm{~V}_{\text {RMS }}$ Noise 100kHz to 20MHz, Operates with Single 3V Supply |
