

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## FEATURES

- 8th Order Filter in a 14-Pin Package
- 80dB or More Stopband Attenuation at  $2 \times f_{\text{CUTOFF}}$
- 50:1,  $f_{\text{CLK}}$  to  $f_{\text{CUTOFF}}$  Ratio (Cauer)  
100:1,  $f_{\text{CLK}}$  to  $f_{-3\text{dB}}$  Ratio (Transitional)
- $135\mu\text{V}_{\text{RMS}}$  Total Wideband Noise
- 0.03% THD or Better
- 100kHz Maximum  $f_{\text{CUTOFF}}$  Frequency
- Operates up to  $\pm 8\text{V}$  Power Supplies
- Input Frequency Range up to 50 Times the Filter Cutoff Frequency

## APPLICATIONS

- Antialiasing Filters
- Telecom Filters
- Sinewave Generators

 LTC and LT are registered trademarks of Linear Technology Corporation.  
LTCMOS is a trademark of Linear Technology Corporation.

## DESCRIPTION

The LTC<sup>®</sup>1064-4 is an 8th order, clock sweepable Cauer lowpass switched capacitor filter. An external TTL or CMOS clock programs the value of the filter's cutoff frequency. With Pin 10 at  $V^+$ , the  $f_{\text{CLK}}$  to  $f_{\text{CUTOFF}}$  ratio is 50:1; the filter has a Cauer response and with compensation the passband ripple is  $\pm 0.1\text{dB}$ . The stopband attenuation is 80dB at  $2 \times f_{\text{CUTOFF}}$ . Cutoff frequencies up to 100kHz can be achieved. With Pin 10 at  $V^-$ , the  $f_{\text{CLK}}$  to  $f_{-3\text{dB}}$  ratio is 100:1, the filter has a transitional Butterworth-Cauer response with lower noise and lower delay nonlinearity than the Cauer response. The stopband attenuation at  $2.5 \times f_{-3\text{dB}}$  is 92dB. Cutoff frequencies up to 50kHz can be achieved.

The LTC1064-4 features low noise and low harmonic distortion even when input voltages up to  $3V_{\text{RMS}}$  are applied. The LTC1064-4 overall performance competes with equivalent multiple op amp active realizations. The LTC1064-4 is pin compatible with the LTC1064-1, LTC1064-2 and LTC1064-3.

The LTC1064-4 is manufactured using Linear Technology's enhanced LTCMOS<sup>™</sup> silicon gate process.

## TYPICAL APPLICATION

8th Order Clock Sweepable Lowpass Elliptic Filter

\* FOR FREQUENCIES ABOVE 20kHz AND MINIMUM PASSBAND RIPPLE REFER TO THE PIN DESCRIPTION SECTION FOR COMPENSATION GUIDELINES.  
NOTE: THE POWER SUPPLIES SHOULD BE BYPASSED BY A  $0.1\mu\text{F}$  CAPACITOR CLOSE TO THE PACKAGE. BYPASSING PIN 10 WITH  $0.1\mu\text{F}$  CAPACITOR REDUCES CLOCK FEEDTHROUGH. THE CONNECTION BETWEEN PINS 7 AND 14 SHOULD BE PHYSICALLY DONE UNDER THE PACKAGE.

Frequency Response

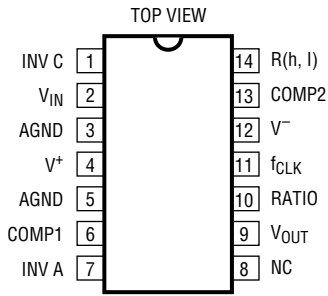

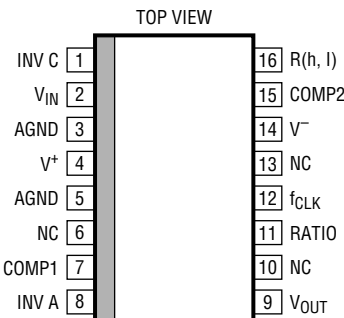

1064-4 TA01b

## PIN FUNCTIONS (Pin Numbers Refer to the 14-Pin Package)

**INV C, COMP1, INV A, COMP2 (Pins 1, 6, 7 and 13):** To obtain a Cauer response with minimum passband ripple and cutoff frequencies above 20kHz, compensating components are required. Figure 6 uses  $\pm 7.5V$  power supplies and compensation components to achieve up to 40kHz *sweepable* cutoff frequencies and  $\pm 0.1dB$  passband ripple. Table 7 lists the typical amplitude response of Figure 6. Figure 7 illustrates the compensation scheme required to obtain a 100kHz cutoff frequency; Graph 4 and Tables 8 and 9 list the typical response of Figure 7 for 25°C and 125°C ambient temperature. As shown the ripple increases at high temperatures but still a  $\pm 0.25dB$  figure can be obtained for ambient temperatures below 70°C.

**V<sub>IN</sub>, V<sub>OUT</sub> (Pins 2, 9):** The input Pin 2 is connected to a 12k resistor tied to the inverting input of an op amp. Pin 2 is protected against static discharge. The device's output, Pin 9, is the output of an op amp which can typically source/sink 3mA/1mA. Although the internal op amps are unity gain stable, driving long coax cables is not recommended.

When testing the device for noise and distortion, the output, Pin 9, should be buffered (Figure 4). *The op amp power supply wire (or trace) should be connected directly to the power source.* To eliminate any output clock feedthrough, Pin 9 should be buffered with a simple R, C lowpass filter (Figure 5). The cutoff frequency of the output filter should be  $f_{CLK}/3$ .

**AGND (Pins 3, 5):** For dual supply operation these pins should be connected to a ground plane. For single supply operation both pins should be tied to one half supply (Figure 2).

**V<sup>+</sup>, V<sup>-</sup> (Pins 4, 12):** Should be bypassed with a 0.1 $\mu F$  capacitor to an adequate analog ground. Low noise, nonswitching power supplies are recommended. *To avoid latchup when the power supplies exhibit high turn-on transients, a 1N5817 Schottky diode should be added from the V<sup>+</sup> and V<sup>-</sup> pins to ground (Figures 1 and 2).*

**INV A, R(h, l) (Pins 7, 14):** A very short connection between Pin 7 and Pin 14 is recommended. This connection should be preferably done under the IC package. In a breadboard, use a one inch, or less, shielded coaxial cable; the shield should be grounded. In a PC board, use a one inch trace or less; surround the trace by a ground plane.

**NC (Pin 8):** Pin 8 is not internally connected, it should be preferably grounded.

**50/100 Ratio (Pin 10):** For an  $f_{CLK}/f_C$  ratio of 50:1, Pin 10 should be tied to V<sup>+</sup>. For an  $f_{CLK}/f_{-3dB}$  ratio of 100:1, Pin 10 should be tied to V<sup>-</sup>. When Pin 10 is at midsupplies (i.e. ground), the filter response is neither Cauer nor transitional. Table 6 illustrates this response. Bypassing Pin 10 with a 0.1 $\mu F$  capacitor reduces the already small clock feedthrough.

## TYPICAL APPLICATIONS
