Chipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

FEATURES

∗ 0.3 INCH (7.62 mm) DIGIT HEIGHT.

∗ FOUR-DIGIT,RIGHT HAND DECIMAL.

∗ WIDE SUPPLY VOLTAGE OPERATION.

∗ SERIAL DATA INPUT.

∗ CONSTANT CURRENT DRIVERS.

∗ CONTINUOUS BRIGHTNESS CONTROL.

∗ OUTPUT AVAILABLE FOR TWO EXTERNAL LEDS.

∗ WIDE VIEWING ANGLE.

∗ TTL COMPATIBLE.

DESCRIPTION

The LTM-8328PKR-04 is a 0.3 inch (7.62mm) digit display. It has a built-in M5450 MOS IC that contains serial data input and 35 bit shift control. The MOS IC produced with N-channel silicon gate technology. This device utilizes bright red LED chips, which are made from GaP on a transparent GaP substrate. Have black face with diffusion tape.

DEVICE

| PART NO	DESCRIPTION
Bright red	FOUR DIGIT R.H.D.P,
LTM-8328PKR-04	WITH I.C DRIVER

PACKAGE DIMENSIONS
NOTES: All dimensions are in millimeters. Tolerances are ±0.25mm(0.01") unless otherwise noted.

ABSOLUTE MAXIMUM RATING AT TA=25ºC

PARAMETER	SYMBOL	MIN.	MAX.	UNIT
Supply Voltage	V_{DD}	-0.3	12	V
Input Voltage	V_I	-0.3	12	V
Off State Output Voltage	$V_O(off)$		12	V
LED Supply Voltage	V_{LED}	2.8	3.5	V
Power Dissipation of IC	$P_D(IC)$		335	mW
Supply Current	I_{DD}		8.5	mA
Operating Temperature Range	T_{OP}	-20	+60	ºC
Storage Temperature Range	Tstg	-20	+60	ºC
Solder Temperature:1/16 inch Below Seating Plane for 3 Seconds at 260ºC					

NOTE:1.All Voltages are with respect to V_{SS}(GND).

2.Power dissipation of IC is given by $P_D = (V_{LED} - V_F) \cdot (I_F) \cdot$ (NO. of Segments) $+ (8.5mA) \cdot (V_{DD})$

* V_F is LED forward voltage.

FUNCTIONAL DESCRIPTION

Serial data transfer from the data source to the display driver is accomplished with 2 signals serial data and clock. Using a format of a leading "1" following by the 35 data bits allows data transfer without an additional load signal. The 35 data bits are latched after the 36th bit is completed, thus providing non-multiplexed, direct drive to the display. Outputs change only if the serial data bits differ from the previous time.

Brightness of display is determined by control the 0utput current of LED display. A 1nF capacitor should be connected to brightness control, Pin 7 to prevent possible oscillations. The output current is typically 25 times greater than the current into Pin 7 which is set by an external variable resistor. There is an internal limiting resistor of 400Ω nominal value.

Figure 1 shows the input data format. A start bit of logical "1" proceed the 35 bits of data. At the 36th clock, a LOAD signal is generated synchronously with the high state of the clock, which loads the 35 bits of the shift registers into the latches. At the low state of the clock a RESET signal is generated which clears all the shift registers for the next set of data. The shift registers are static master-slave configuration. There is no clear for portion of the first register, thus allowing continuous operation.

There must be a complete set of 36 clocks or the shift registers won't clear. When power is first applied to the chip an internal power ON reset signal is generated which reset all registers and all latched. The ATART bit and first clock return the chip on its normal operation. Bit 1 is the first following the start bit and it will appear on the Figure 2 shows the timing relationship between data clock, and DATA ENABLE. A maximum clock frequency of 0.5 MHz is assumed.
