## Photocoupler LTV-0601 series

### 1. DESCRIPTION

The LTV-0601 consists of a high efficient AlGaAs Light Emitting Diode and a high speed optical detector. This design provides excellent AC and DC isolation between the input and output sides of the Optocoupler. The output of the optical detector features an open collector Schottky clamped transistor. The enable function allows the optical detector to be strobed. A guaranteed common mode transient immunity is up to 10kV/ $\mu$ s at 3.3V.

The Optocoupler operational parameters are guaranteed over the temperature range from -40°C ~ +85°C.

#### 1.1 Features

Input-Output Capacitance	$C_{I-O}$	—	1.0	—	$\text{pF}$	$f = 1\text{MHz}$ , $T_A = 25^\circ\text{C}$	9,

Specified over recommended temperature ( $T_A = -40^\circ\text{C}$  to  $+85^\circ\text{C}$ ) unless otherwise specified. Typical values applies to  $T_A = 25^\circ\text{C}$

#### Note:

1. A  $0.1\mu\text{F}$  or bigger bypass capacitor for  $V_{CC}$  is needed.
2. Peaking driving circuit may be used to speed up the LED. The peak drive current of LED may go up to  $50\text{mA}$  and maximum pulse width  $50\text{ns}$ , as long as average current doesn't exceed  $20\text{mA}$ .
3.  $t_{PLH}$  (propagation delay) is measured from the  $3.75\text{mA}$  point on the falling edge of the input pulse to the  $1.5\text{V}$  point on the rising edge of the output pulse.
4.  $t_{PHL}$  (propagation delay) is measured from the  $3.75\text{mA}$  point on the rising edge of the input pulse to the  $1.5\text{V}$  point on the falling edge of the output pulse.
5. The  $t_{ELH}$  enable propagation delay is measured from the  $1.5\text{V}$  point on the falling edge of the enable input pulse to the  $1.5\text{V}$  point on the rising edge of the output pulse.
6. The  $t_{EHL}$  enable propagation delay is measured from the  $1.5\text{V}$  point on the rising edge of the enable input pulse to the  $1.5\text{V}$  point on the falling edge of the output pulse.
7.  $CM_H$  is the maximum tolerable rate of rise of the common mode voltage to assure that the output will remain in a high logic state (i.e.,  $V_O > 2.0\text{V}$ ).
8.  $CM_L$  is the maximum tolerable rate of fall of the common mode voltage to assure that the output will remain in a low logic state (i.e.,  $V_O < 0.8\text{V}$ ).
9. Device is considered a two-terminal device: pins 1, 2, 3 and 4 shorted together, and pins 5, 6, 7 and 8 shorted together.
10. In accordance with UL1577, each optocoupler is proof tested by applying an insulation test voltage  $4500\text{Vrms}$  for one second (leakage current less than  $10\mu\text{A}$ ). This test is performed before the 100% production test for partial discharge
11. No external pull up is required for a high logic state on the enable input. If the  $V_E$  pin is not used, tying  $V_E$  to  $V_{CC}$  will result in improved CMR performance.
12.  $t_{PSK}$  is equal to the worst case difference in  $t_{PHL}$  and/or  $t_{PLH}$  that will be seen between units at any given temperature and specified test conditions.
