## : ©hipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation, and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## Photocouplers

LTV-3150 series

## 1. DESCRIPTION

The LTV-3150 optocoupler is ideally suited for driving power IGBTs and MOSFETs used in motor control inverter applications and inverters in power supply system. It contains an AIGaAs LED optically coupled to an integrated circuit with a power output stage. The 1.0A peak output current is capable of directly driving most IGBTs with ratings up to $1200 \mathrm{~V} / 50 \mathrm{~A}$. For IGBTs with higher ratings, the LTV-3150 series can be used to drive a discrete power stage which drives the IGBT gate.

The Optocoupler operational parameters are guaranteed over the temperature range from $-40^{\circ} \mathrm{C} \sim+105^{\circ} \mathrm{C}$.

### 1.1 Features

- 1.0 A maximum peak output current
- 0.8 A minimum peak output current
- Rail-to-rail output voltage
- 400 ns maximum propagation delay
- 150 ns maximum propagation delay difference
- Under Voltage Lock-Out protection (UVLO) with hysteresis
- $15 \mathrm{kV} / \mathrm{us}$ minimum Common Mode Rejection (CMR) at $\mathrm{V}_{\mathrm{CM}}=1500 \mathrm{~V}$
- $\mathrm{I}_{\mathrm{Cc}}=3.0 \mathrm{~mA}$ maximum supply current
- Wide operating range: 15 to 30 Volts ( $\mathrm{V}_{\mathrm{CC}}$ )
- Guaranteed performance over temperature $-40^{\circ} \mathrm{C} \sim+105^{\circ} \mathrm{C}$.
- Offer low power dissipation with $\mathrm{R}_{\mathrm{ON}} \leq 1 \Omega$
- MSL Level 1
- Safety approval:
- UL/ cUL Recognized 5000 V $_{\text {RMS }} / 1 \mathrm{~min}$
- IEC/EN/DIN EN 60747-5-5 V ${ }^{\text {IORM }}=630$ Vpeak

### 1.2 Applications

- IGBT/MOSFET gate drive

■ Uninterruptible power supply (UPS)

- Industrial Inverter

## Notes:

1) Maximum pulse width $=10 \mu \mathrm{~s}$, maximum duty cycle $=0.2 \%$.
2) Output is sourced at -0.8 A with a maximum pulse width $=10 \mu \mathrm{~s}$. $\mathrm{V}_{\mathrm{cc}}-\mathrm{V}_{\mathrm{O}}$ is measured to ensure 15 V or below.
3) Output is sourced at 0.8 A with a maximum pulse width $=10 \mu \mathrm{~s} . \mathrm{V}_{\mathrm{O}}-\mathrm{V}_{\text {EE }}$ is measured to ensure 15 V or below.
4) In this test $\mathrm{V}_{\mathrm{OH}}$ is measured with a DC load current. When driving capacitive loads, $\mathrm{V}_{\mathrm{OH}}$ will approach $\mathrm{V}_{\mathrm{CC}}$ as $\mathrm{I}_{\mathrm{OH}}$ approaches zero amps.
5) Device is considered a two terminal device: pins 1, 2, 3 and 4 are shorted together and pins 5, 6, 7 and 8 are shorted together.
6) According to UL1577, each photocoupler is tested by applying an insulation test voltage $5250 \mathrm{~V}_{\text {RMs }}$ for one second (leakage current less than $10 \mu \mathrm{~A}$ ). This test is performed before the $100 \%$ production test for partial discharge
7) The difference between $T_{\text {PHL }}$ and $T_{\text {PLL }}$ between any two LTV-3150 parts under same test conditions.
8) Common mode transient immunity in high stage is the maximum tolerable negative $\mathrm{dV}_{\mathrm{C}_{\mathrm{C}}} / \mathrm{dt}$ on the trailing edge of the common mode impulse signal, $\mathrm{V}_{С \mathrm{CM}}$, to assure that the output will remain high.
9) Common mode transient immunity in low stage is the maximum tolerable positive $\mathrm{dV}_{\mathrm{CN} / \mathrm{dt}}$ on the leading edge of the common mode impulse signal, $\mathrm{V}_{\mathrm{CM}}$, to assure that the output will remain low.
10) Pulse Width Distortion is defined as $T_{\text {PHL }}-T_{\text {PLH }}$ for any given device.
11) At least a $0.1 \mu \mathrm{~F}$ or bigger bypass capacitor must be connected/closed across pin 8 and pin 5 . Failure to provide the bypass may impair the switching property. Normally, it is recommended to place a $1 \mu \mathrm{~F}$ multi-layer ceramic capacitor. To parallel one larger capacitor $(>1 \mu \mathrm{~F})$ to optimize performance is better.
