

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Bi-CMOS IC

PWM Constant-Current Control Stepper Motor Driver

http://onsemi.com

Overview

The LV8746V is a stepper motor driver corresponding to the Quarter-step excitation drive that the selection of CLK-IN input and a parallel input is possible. It is ideally suited for driving stepper motors used in office equipment and amusement applications.

Function

- PWM current control stepper motor driver incorporated.
- BiCDMOS process IC
- Low on resistance (upper side : 0.84Ω ; lower side : 0.7Ω ; total of upper and lower : 1.54Ω ; Ta = 25° C, IO = 1A)
- Excitation mode can be set to Full-step, Half-step Full torque, Half-step, or Quarter-step
- CLK-IN input and a parallel input can be selected.
- Motor current selectable in four steps
- Output short-circuit protection circuit (selectable from latch-type or auto-reset-type) incorporated
- Unusual condition warning output pins
- No control supply required

Specifications

Absolute Maximum Ratings at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage	VM max	VM , VM1 , VM2	38	V
Output peak current	I _O peak	tw ≤ 10ms, duty 20% , Per 1ch	1.2	Α
Output current	I _O max	Per 1ch	1	Α
Logic input voltage	V _{IN}		-0.3 to +6	V
EMO input voltage	Vemo		-0.3 to +6	V
Allowable power dissipation	Pd max	*	3.1	W
Operating temperature	Topr		-20 to +85	°C
Storage temperature	Tstg		-55 to +150	°C

^{*} Specified circuit board : 90.0mm×90.0mm×1.6mm, glass epoxy 2-layer board, with backside mounting.

Caution 1) Absolute maximum ratings represent the value which cannot be exceeded for any length of time.

Caution 2) Even when the device is used within the range of absolute maximum ratings, as a result of continuous usage under high temperature, high current, high voltage, or drastic temperature change, the reliability of the IC may be degraded. Please contact us for the further details.

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

Allowable Operating Ratings at Ta = 25°C

Parameter	Symbol	Conditions	Ratings	Unit
Supply voltage range	VM	VM,VM1,VM2	9 to 35	V
Logic input voltage	V _{IN}	ST,OE/I12,DM,MD1/I02,MD2/PH2,FR/I11,S TP/I01,RST/PH1,ATT1,ATT2	0 to 5.5	V
VREF input voltage range	VREF		0 to 3	V

ORDERING INFORMATION

See detailed ordering and shipping information on page 24 of this data sheet.

Electrical Characteristics at Ta = 25°C, VM = 24V, VREF = 1.5V

Package Dimensions

unit : mm (typ) 3333A

Substrate Specifications (Substrate recommended for operation of LV8746V)

Size : $90\text{mm} \times 90\text{mm} \times 1.6\text{mm}$ (two-layer substrate [2S0P])

Material : Glass epoxy

Copper wiring density : L1 = 85% / L2 = 90%

8888

L1: Copper wiring pattern diagram

L2: Copper wiring pattern diagram

Cautions

- 1) The data for the case with the Exposed Die-Pad substrate mounted shows the values when 90% or more of the Exposed Die-Pad is wet.
- 2) For the set design, employ the derating design with sufficient margin.

Stresses to be derated include the voltage, current, junction temperature, power loss, and mechanical stresses such as vibration, impact, and tension.

Accordingly, the design must ensure these stresses to be as low or small as possible.

The guideline for ordinary derating is shown below:

- (1)Maximum value 80% or less for the voltage rating
- (2)Maximum value 80% or less for the current rating
- (3)Maximum value 80% or less for the temperature rating
- 3) After the set design, be sure to verify the design with the actual product.

Confirm the solder joint state and verify also the reliability of solder joint for the Exposed Die-Pad, etc. Any void or deterioration, if observed in the solder joint of these parts, causes deteriorated thermal conduction, possibly resulting in thermal destruction of IC.

Description of operation

1.Input Pin Function

1-1) Chip enable function

This IC is switched between standby and operating mode by setting the ST pin. In standby mode, the IC is set to power-save mode and all logic is reset. In addition, the internal regulator circuit and charge pump circuit do not operate in standby mode.

ST	Mode	Internal regulator	Charge pump
Low or Open	Standby mode	Standby	Standby
High	Operating mode	Operating	Operating

1-2) Input control method switching pin function

The IC input control method is switched by setting the DM pin. The CLK-IN input control and the parallel input control can be selected by setting the DM pin.

DM	Input control method
Low or Open	CLK-IN input control
High	Parallel input control

2. CLK-IN input control (DM = Low or Open)

2-1) STEP pin function

Inj	out	Operating mode
ST	STP	
Low	*	Standby mode
High		Excitation step proceeds
High	—	Excitation step is kept

2-2) Excitation mode setting function

MD1	MD2	Micro-step resolution	Initial p	position
		(Excitation mode)	Channel 1	Channel 2
Low	Low	Full step (2 phase excitation)	100%	-100%
High	Low	Half step (1-2 phase excitation) Full torque	100%	0%
Low	High	Half step (1-2 phase excitation)	100%	0%
High	High	Quarter step (W1-2 phase excitation)\	100%	0%

This is the initial position of each excitation mode in the initial state after power-on and when the counter is reset.

2-3) Setting constant-current control reference voltage

<u>,</u>		
ATT1	ATT2	Current setting reference voltage
Low	Low	VREF / 5 x 100%
High	Low	VREF / 5 x 67%
Low	High	VREF / 5 x 50%
High	High	VREF / 5 x 33%

The voltage input to the VREF pin can be switched to four-step settings depending on the statuses of the two inputs, ATT1 and ATT2. This is effective for reducing power consumption when motor holding current is supplied.

Set current value calculation method.

The reference voltage is set by the voltage applied to the VREF pin and the two inputs ATT1 and ATT2. The output current (output current at a constant-current drive current ratio of 100%) can be set from this reference voltage and the RF resistance value.

 $I_{OUT} = (VREF/5) \times (current attenuation ratio) / RF resistance$

Example : At VREF of 1.5V, a reference voltage setting of 100% [(ATT1, ATT2) = (L, L)] and an RF resistance of 0.47Ω , the output current is set as shown below.

 $I_{OUT} = 1.5V/5 \times 100\%/0.47\Omega = 0.64A$

2-4) Input Timming

TstepH/TstepL: Clock H/L pulse width (min 500ns)

Tds: Data set-up time (min 500ns) Tdh: Data hold time (min 500ns)

2-5) Blanking period

If, when exercising PWM constant-current chopping control over the motor current, the mode is switched from decay to charge, the recovery current of the parasitic diode may flow to the current sensing resistance, causing noise to be carried on the current sensing resistance pin, and this may result in erroneous detection. To prevent this erroneous detection, a blanking period is provided to prevent the noise occurring during mode switching from being received. During this period, the mode is not switched from charge to decay even if noise is carried on the current sensing resistance pin. In the blanking time for this IC, it is fixed one sixteenth of chopping cycle.

2-6) Reset function

RST	Operating mode
Low	Normal operation
High	Reset state

When the RST pin is set to High, the excitation position of the output is forcibly set to the initial state. When RST is then set to Low, the excitation position is advanced by the next STEP input.

2-7) Output enable function

OE	Operating mode
Low	Output ON
High	Output OFF

When the OE pin is set High, the output is forced OFF and goes to high impedance.

However, the internal logic circuits are operating, so the excitation position proceeds when the STEP signal is input. Therefore, when OE is returned to Low, the output level conforms to the excitation position proceeded by the STEP input.

2-8) Forward/reverse switching function

FR	Operating mode		
Low	CW		
High	ccw		

The internal D/A converter proceeds by one bit at the rising edge of the input STEP pulse.

In addition, CW and CCW mode are switched by setting the FR pin.

In CW mode, the channel 2 current phase is delayed by 90° relative to the channel 1 current.

In CCW mode, the channel 2 current phase is advanced by 90° relative to the channel 1 current.

2-9) Chopping frequency setting

For constant-current control, chopping operation is made with the frequency determined by the external resistor The chopping frequency to be set with the resistance connected to the RCHOP pin (pin 11) is as shown below.

2-10) Output current vector locus (one step is normalized to 90 degrees)

Setting current ration in each micro-step mode

STEP	Quarter-	step (%)	Half-st	ep (%)	Half-step ful	I torque (%)	Full-ste	p (%)
	Channel 1	Channel 2	Channel 1	Channel 2	Channel 1	Channel 2	Channel 1	Channel 2
θ0	0	100	0	100	0	100		
θ1	33.3	100						
θ2	66.7	66.7	66.7	66.7	100	100	100	100
θ3	100	33.3						
θ4	100	0	100	0	100	0		

2-11) Typical current waveform in each excitation mode Full step (CW mode)

Half step Full torque (CW mode)

Half step (CW mode)

Quarter step (CW mode)

2-12) Current control operation specification

(Sine wave increasing direction)

(Sine wave decreasing direction)

In each current mode, the operation sequence is as described below:

- At rise of chopping frequency, the CHARGE mode begins. (The section in which the CHARGE mode is forced regardless of the magnitude of the coil current (ICOIL) and set current (IREF) exists for 1/16 of one chopping cycle.)
- The coil current (ICOIL) and set current (IREF) are compared in this forced CHARGE section.

When (ICOIL<IREF) state exists in the forced CHARGE section;

CHARGE mode up to ICOIL \geq IREF, then followed by changeover to the SLOW DECAY mode, and finally by the FAST DECAY mode for the 1/16 portion of one chopping cycle.

When (ICOIL<IREF) state does not exist in the forced CHARGE section;

The FAST DECAY mode begins. The coil current is attenuated in the FAST DECAY mode till one cycle of chopping is over.

Above operations are repeated. Normally, the SLOW (+FAST) DECAY mode continues in the sine wave increasing direction, then entering the FAST DECAY mode till the current is attenuated to the set level and followed by the SLOW DECAY mode.

3. Parallel input control (DM-High)

3-1) Parallel input control logic

I01(02)	I11(12)	Output current (I _O)	
Low	Low	0	
High	Low	I _O = ((VREF/5)/RF)×1/3	
Low	High	$I_{O} = ((VREF/5)/RF) \times 2/3$	
High	High	I _O = (VREF/5)/RF	

PH1(2)	current direction
Low	$OUTB \to OUTA$
High	OUTA → OUTB

3-2) Setting constant-current control reference voltage

The constant current control standard voltage setting function is the same specification as the CLK-IN input control.

3-3) Current control function

The current control function is the same use as the CLK-IN input control.

3-4) Typical current waveform in each excitation mode when stepping motor parallel input control Full step (CW mode)

Half step full torque (CW mode)

4. Output short-circuit protection function

This IC incorporates an output short-circuit protection circuit that, when the output has been shorted by an event such as shorting to power or shorting to ground, to prevent the thing that IC destroys, the output short-circuit protection circuit that turns off the output is built into.

4-1) Protection function operation(Latch type)

The detection of the output short-circuited state by the IC causes the output short-circuit protection circuit to be activated.

When the short-circuited state continues for the period of time set using the internal timer (1/4 of chopping cycle), the output in which the short-circuiting has been detected is first set to OFF. After this, the output is set to ON again as soon as the timer latch time (Tcem) described later has been exceeded, and if the short-circuited state is still detected, all the outputs of the channel concerned are switched to the standby mode, and this state is held.

4-2) Unusual condition warning output pins (EMO)

IC is provided with the EMO pin which notifies the CPU of an unusual condition if the protection circuit operates by detecting an unusual condition of the IC. This pin is of the open-drain output type and when an unusual condition is detected, the EMO output is placed in the ON (EMO = Low) state.

Furthermore, the EMO pin is placed in the ON state when one of the following conditions occurs.

- 1. Shorting-to-power, shorting-to-ground, or shorting-to-load occurs at the output pin and the output short-circuit protection circuit is activated.
- 2. The IC junction temperature rises and the thermal protection circuit is activated.

4-3) Timer latch time (Tcem)

The time taken for the output to be set to OFF when the output has been short-circuited can be set using capacitor Ccem, connected between the CEM pin and GND. The value of capacitor Ccem is determined by the formula given below.

Timer latch : Teem \sim Ceem \times Vteem/Icem [sec]

Vtcem : Comparator threshold voltage, typ 1V Icem : CEM pin charge current, typ $10\mu A$

5. Charge Pump Circuit

When the ST pin is set High, the charge pump circuit operates and the VG pin voltage is boosted from the VM voltage to the VM + VREG5 voltage. If the VG pin voltage is not boosted sufficiently, the output cannot be controlled, so be sure to provide a wait time of tONG or more after setting the ST pin High before starting to drive the motor.

VG Pin Voltage Schematic View

6. Thermal shutdown function

The thermal shutdown circuit is included, and the output is turned off when junction temperature Tj exceeds $180\Box C$ and the abnormal state warning output is turned on at the same time.

When the temperature falls hysteresis level, output is driven again (automatic restoration)

The thermal shutdown circuit doesn't guarantee protection of the set and the destruction prevention of IC, because it works at the temperature that is higher than rating (Tjmax=150°C) of the junction temperature

 $TTSD = 180^{\circ}C \text{ (typ)}$

 Δ TSD = 40°C (typ)

Application Circuit Example

• Clock Inn mode application circuit

The setting conditions for the above circuit diagram example are as follows:

- 2-phase excitation (MD1/I02 = Low, MD2/PH2 = Low)
- Reset function fixed to normal operation (RST = Low)
- Chopping frequency : 62.5kHz (RCHOP = 20k Ω)

ATT1	ATT2	Current setting reference voltage
Low	Low	VREF/5×100%
High	Low	VREF/5×67%
Low	High	VREF/5×50%
High	High	VREF/5×33%

The set current value is as follows:

 $I_{OUT} = (VREF/5 \times Voltage setting ratio) / RF$

Example) When ATT=Low,ATT2=Low (VREF = 1.5V,RF=0.47\Omega)
$$I_{OUT} = (1.5V/5\times1)/0.47\Omega = 0.64A$$

• DC motor driver circuit (DM = High, and the current limit function is in use.)

The setting conditions for the above circuit diagram example are as follows:

• Chopping frequency : 62.5kHz (RCHOP = 20k Ω)

I01(02)	I11(12)	Output current (I _O)
Low	Low	0
High	Low	I _O = ((VREF/5) / RF) × 1/3
Low	High	I _O = ((VREF/5) / RF) × 2/3
High	High	I _O = (VREF/5) / RF

Example) When ATT=Low,ATT2=Low,I01(02)=High,I11(12)=High (VREF = 1.5V,RF=0.47\Omega) I_OUT = (1.5V / 5 × 1) / 0.47\Omega = 0.64A

PH1(2)	Electrical current direction	
Low	$OUTB \rightarrow OUTA$	
High	$OUTA \rightarrow OUTB$
