

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Address: A1208, Overseas Decoration Building, #122 Zhenhua RD., Futian, Shenzhen, China

Features

- Precise detection of call progress tones
- Linear (analog) input
- Digital (CMOS compatible), tri-state outputs
- 22-pin DIP and 20-pin SOIC
- Single supply 3 to 5 volt (low power CMOS)
- Inexpensive 3.58 MHz crystal time base
- Wide dynamic range (30 dB)
- Lower power consumption (power-down mode)
- 425 Hz detection
- Special Information Tone (SIT) Detection

Applications

- Automatic dialers
- Dialing modems
- Traffic measurement equipment
- Test equipment
- Service evaluation
- Billing systems

Description

The M-985-01 is an integrated circuit precise tone detector for call progress and special information tones (SIT), as defined by CCITT.

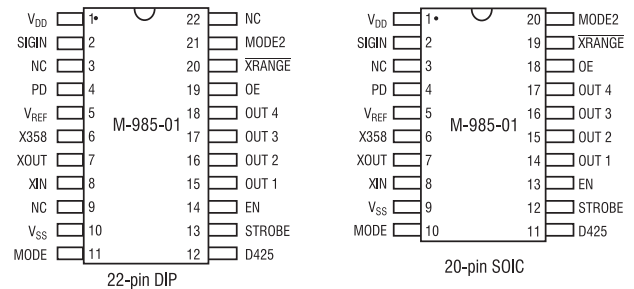

The use of integrated circuit techniques allows the M-985-01 to pack the eight filters for call progress detection into a single 22-pin DIP or a 20-pin SOIC. A 3.58 MHz crystal-controlled time base guarantees accuracy and repeatability.

The M-985-01 combines the call progress detection of the M-982-02 and the SIT detection of the M-984-02. It has an operating voltage range down to 3V. It has low power consumption under normal operating conditions. A power down (PD) feature is provided to further reduce power consumption when inactive.

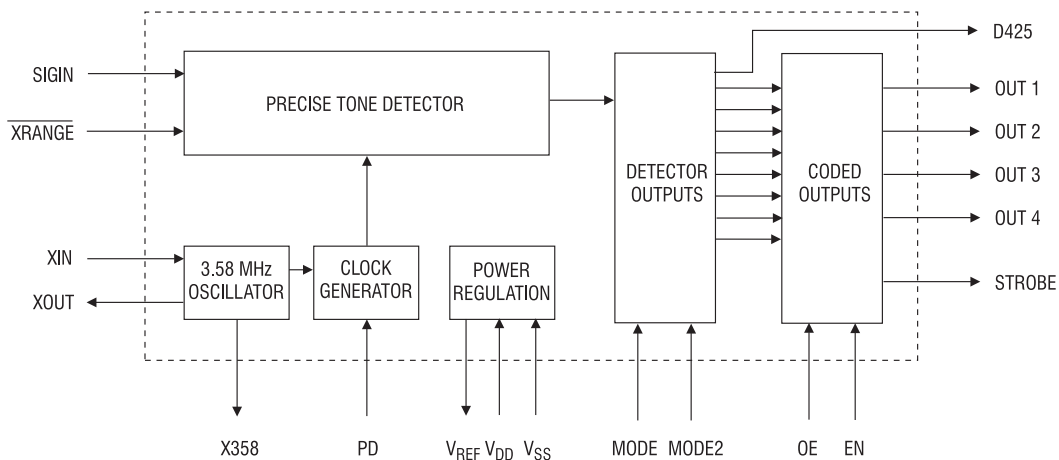

Ordering Information

Part #	Description
M-985-01P	22-pin plastic DIP
M-985-01S	20-pin plastic SOIC
M-985-01T	20-pin plastic SOIC, Tape and Reel

Pin Diagram

Block Diagram

**Absolute Maximum Ratings**

Storage Temperature	-40 to 150°C
Operating Ambient Temperature	-40 to 85°C
V _{DD}	7V
Input Voltage on SIGIN	V _{SS} - 6.5 to V _{DD} + 0.3V
Input Voltages (except SIGIN)	V _{SS} - 0.3 to V _{DD} + 0.3 V
Lead Soldering Temperature	260° C for 5 seconds

Note:

Exceeding these ratings may permanently damage the M-985-01.

Absolute Maximum Ratings are stress ratings. Stresses in excess of these ratings can cause permanent damage to the device. Functional operation of the device at these or any other conditions beyond those indicated in the operational sections of this data sheet is not implied. Exposure of the device to the absolute maximum ratings for an extended period may degrade the device and effect its reliability.

Specifications

Parameter		Conditions	Min	Max	Units	Notes
Operating Conditions	V _{DD}	-	2.7	5.5	V	-

		Internal resistance	-	20	-	M Ω	-
		Power up (t_{PU})	PD hi to lo	-	30	ms	-
	X358 pin	V_{OL}	$C_L = 20 pF,$ $I_{SINK} = -1mA$	-	0.2	V	-
		V_{OH}	$C_L = 20 pF,$ $I_{SOURCE} = 1mA$	$V_{DD} - 0.2$	-	V	-
Duty cycle		$C_L = 20 pF$	40	60	%	-	
Tri-state Operation	t_{EN} (High Z to Low Z)	$C_L = 50 pF,$	-	250	ns	-	
	t_{DE} (Low Z to High Z)	$R_L = 100 k\Omega$	-	250	ns	-	

Unless otherwise noted, $V_{DD} - V_{SS} = 5V$, $T_a = 25^\circ C$, PD at logical low state, and $XRANGE$ at a logical high state. Power levels are in dBm referenced to 600 ohm. DC voltages are referenced to V_{SS} .

Notes:

1. Per tone.
2. See Table 4 for detection/rejection frequencies.

Call Progress Tone Detection

Call progress tones are audible tones sent from switching systems to calling parties to show the status of calls. Calling parties can identify the success of a call placed by what is heard after dialing. The type of tone used and its timing vary from system to system, and though intended for human ears these signals can provide valuable information for automated calling systems.

The M-985-01 contains five signal detectors sensitive to the frequencies often used for these progress tones.

Electronic equipment monitoring the OUTn outputs of the M-985-01 can determine the nature of signals present by measuring their duty cycle. See Mechanical Dimensions for a diagram of a circuit that could be used to permit a microcomputer to directly monitor tones on the telephone line. Much of the character of the progress tones is in their duty cycle or cadence (sometimes referred to as interruption rate). This information, coupled with level and frequency indication from the M-985-01, can be used to decide what progress tones have been encountered.

Pin Functions

Pin	Function
OUT 1	Active high tri-state output, per Truth Table.
OUT 2	Active high tri-state output, per Truth Table.
OUT 3	Active high tri-state output, per Truth Table
OUT 4	Active high tri-state output, per Truth Table
D425	Active high tri-state output, indicates 425 Hz detection.
EN	Active high enabled, when low drives STROBE low.
OE	Active high input. When low tri-states OUT n pins.
SIGIN	Analog signal input (internally capacitive coupled).
STROBE	Active high output, indicates valid OUT n or D425
VDD	Most positive power supply input pin.
VREF	Internally generated mid-power supply voltage (output)
V _{SS}	Most negative power supply input pin.
X358	Buffered oscillator output (3.58 MHz).
XIN	Crystal oscillator or digital clock input.
XOUT	Crystal oscillator output. Used only with a crystal. Use X358 when clock output signal is required.
XRANGE	Active low input. Adds 10 dB of gain to input stage.
MODE	Selects 400/620 Hz detector frequency, 400 Hz when connected to V _{SS} , 620 Hz when open.
PD	Power down operation, logic high inhibits internal clock. Internal pulldown resistor.
MODE2	Tie high (V _{DD}) for normal operation. Tie low or leave open to emulate M-982 operation.

For example, dial tones shown in absolute Maximum Ratings Table on page 3, are usually “on” continuously and last until the first dial digit is received by the switching system. Line Busy, on the other hand, is turned off and on at a rate of 1 Hz with a 50% duty cycle, or an interruption rate of 60 times per minute (60 IPM). The tones can be distinguished in this way. It should be noted that while such techniques will usually be effective, there are some circumstances in which the M-985-01 cannot be accurately used. Examples include situations where ringback tone may be short or not even encountered. Ringback may be provided at ringing voltage frequency (20 or 30 Hz) with some harmonics and may not fall in the detect range, and speech or other strong noise may obscure tones making cadence measurement difficult.

Standards exist and should be consulted for your particular application. In North America AT&Ts “Notes on the Network” or EIA’s RS-464 PBX standard should be reviewed.

In Europe tone plans may vary with locale, in which case the CEPT administration in each country must be consulted. Outside these areas, national PTT organizations can provide information on the systems within their borders.

Truth Table

Signal Present (fo)	Mode	OUT 1	OUT 2	OUT 3	OUT 4	D425	Strobe	PD	OE	EN
350 Hz	X	1	0	0	0	X	1	0	1	1
