

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

1. INTRODUCTION

The M0116LD Vacuum Fluorescent Display module consists of a 1 row x 16 digit display with one chip controller on board.

2. FEATURES

- 2.1 The MCU can control this module by four control signals, chip select (/SEL), shift clock (SCLK) and serial data (SDATA) and reset (/RST).
- 2.2 Since a DC/DC convert is used, only +12Vdc power source is required to operate the module.
- 2.3 One chip controller mounted on the module includes the character generator ROM (CG-ROM) of 96 ASCII and 152 European characters.
- 2.4 Eight brightness levels can be selected by dimming function.
- 2.5 High quality blue-green (505nm) vacuum fluorescent display provides an attractive and readable medium. Other colors can be achieved by simple wavelength filters.
- 2.6 Characters are provided with a 5×7 dot matrix.
- 2.7 The module has up to 8 user definable characters. (CG-RAM function)

3. GENERAL DESCRIPTIONS

- 3.1 This specification becomes effective after being approved by the purchaser.
- 3.2 When any conflict is found in the specification, appropriate action shall be taken upon agreement of both parties.
- 3.3 The expected necessary service parts should be arranged by the customer before the completion of production.

5. FUNCTION DESCRIPTIONS

A display control command or character data is written by the 8-bit serial synchronous transfer mode. The Figure-6 shows the write timing chart.

When the /SEL pin is low (logic"0"), data can be transferred. Data with 8bits length is input into the SDATA pin sequentially from LSB. (**LSB First. MSB last**)

Data is shifted at the rising edge of a shift clock pulse which is input to the SCLK pin as shown in the Figure_6. When data with 8 bits length is entered, an inner LOAD signal is automatically generated, and data is written into the register and RAM. Accordingly, there is no need to input an external LOAD signal.

If the /SEL pin is changed from LOW to HIGH, the serial transfer is inhibited, and data, which is entered after the /SEL pin is changed from HIGH to LOW, is recognized in unit of 8-bits.

Figure-6. 3-Wired Synchronous Serial Input Timing

5.1 Character Code Write-in

When the first 8-bits data is a command of "DP" (Refer to section 5.2.1) after the /SEL pin is changed from HIGH to LOW, the following codes are treated as display character data. At this time, the display address (Write-in Position) is shifted to the right one digit automatically.

If a user wanted to move the write-in position, the user should make a positive pulse on /SEL pin and re-enter a "DP" command.

Figure-7 Character Codes Write-in diagram

5.1.1 CG-RAM Character (00 Hex~ 07 Hex)

A user should define the CG-RAM font by UDF function (Refer to section 5.2.2), before entering the CG-RAM code into VFD module.

5.1.2 CG-ROM Character (08 Hex~ FF Hex)

When the CG-ROM character data code is written-in the module, the corresponding character font (Refer to Table_11) is display at current address (write-in position)

5.2 Control Command write-in

The control commands should be written-in first after the /SEL pin is changed from HIGH to LOW. The control commands are listed up Table_10 and details will be explained.

Table_10

Symbol	Description	Hex Code	Binary Code							
			b7	b6	b5	b4	b3	b2	b1	b0
DP	Display Position (Address Set)	10~1F Hex	0	0	0	1	*	*	*	*
UDF	User Definable Font (Save CG-RAM Data)	20~27 Hex	0	0	1	0	×	*	*	*
CMDP	Comma and/or Decimal Point on/off	30~3F Hex	0	0	1	1	*	*	*	*
DIM	Dimming (Luminance Control)	50~57 Hex	0	1	0	1	×	*	*	*
DLNG	Digit Length Set	60~67 Hex	0	1	1	0	×	*	*	*
ALL	All Segments on/off	70~73 Hex	0	1	1	1	×	×	*	*

×: Don't Care, *: Selection Bits, 0: Low Level, 1: High Level

5.2.1 DP (10 Hex~ 1F Hex) : Set Display Position (write-in Address)

This command is used to select a digit to display a character instead of writing the character from the first digit, the write-in starting position can be pointed out by using this command.

Table_11

Binary								HEX	Digit
b7	b6	b5	b4	b3	b2	b1	b0		
0	0	0	1	0	0	0	0	10	Left End
				0	0	0	1	11	2nd Digit
				0	0	1	0	12	3rd Digit
				0	0	1	1	13	4th Digit
				0	1	0	0	14	5th Digit
				0	1	0	1	15	6th Digit
				0	1	1	0	16	7th Digit
				0	1	1	1	17	8th Digit

Binary								HEX	Digit
b7	b6	b5	b4	b3	b2	b1	b0		
0	0	0	1	1	0	0	0	18	9th Digit
				1	0	0	1	19	10th Digit
				1	0	1	0	1A	11th Digit
				1	0	1	1	1B	12th Digit

				1	1	0	1	1D	14th Digit
				1	1	1	0	1E	15th Digit
				1	1	1	1	1F	Last Digit

5.2.2 UDF (20 Hex ~ 27 Hex) : User Definable Font (Save CG-RAM Font Data)

The characters can be designed by using this command. These font data are memorized in the CG-RAM of the module. Any 5×7 dots pattern can be stored in the character code location specified by the b0 ~b2 of 1st byte.

Table 12

	b7	b6	b5	b4	b3	b2	b1	b0	Location	Description
1st byte	0	0	1	0	×	0	0	0	CG-RAM0	Specify UDF command and character code location (CG-RAM0~CG-RAM7)
						0	0	1	CG-RAM1	
						0	1	0	CG-RAM2	
						0	1	1	CG-RAM3	
						1	0	0	CG-RAM4	
						1	0	1	CG-RAM5

Bit Map of 5×7 Dot Matrix

5.2.3 CMDP (30 Hex~3F Hex) : Comma and /or Decimal Point On/OFF

This command is useful for comma and/or decimal point display ON/OFF. Table 14

	b7	b6	b5	b4	b3	b2	b1	b0	Digit	Description
1st byte	0	0	1	1	0	0	0	0	Left end	Specify CMDP command and display address.
					0	0	0	1	2nd Digit	
					0	0	1	0	3rd Digit	
					⋮	⋮	⋮	⋮	⋮	
					1	1	0	1	14th Digit	
					1	1	1	0	15th Digit	
1	1	1	1	16th Digit						
2nd byte	×	×	×	×	×	×	0	0	Comma Off, Decimal Point Off(Default Vaule)	
							0	1	Comma Off, Decimal Point On	
							1	0	Comma On, Decimal Point Off	
							1	1	Comma On, Decimal Point On	

×: Don't Care

This command is similar to DP function.
 When a user want to display comma and/or decimal point continuously, it isn't needed to re-enter this command. i.e the write-in position is increased automatically after input of 2nd byte. Consequently, if a user doesn't want to display more comma and/or decimal point, the user should make a positive pulse of /CS and write-in DP or another command code.

5.2.4 DIM (50 Hex~ 57 Hex): Dimming

Brightness can be controlled into 8 levels by using this function.

Table_15

b7	b6	b5	b4	b3	b2	b1	b0	Dimming Level
0	1	0	1	×	0	0	0	50%(8/16) Default Value
					0	0	1	56%(9/16)
					0	1	0	62%(10/16)
					0	1	1	69%(11/16)
					1	0	0	75%(12/16)
					1	0	1	81%(13/16)
					1	1	0	87%(14/16)
					1	1	1	94%(15/16), Maximum value

5.2.5 DLNG (60 Hex~ 67 Hex): Set Display Length

This command is used to defined the number of display digit.(9 to 16 Digits)

Table_16

b7	b6	b5	b4	b3	b2	b1	b0	Dimming Level
0	1	1	0	×	0	0	0	1~16 Digit Default Value
					0	0	1	1~9 Digit
					0	1	0	1~10 Digit
					0	1	1	1~11 Digit
					1	0	0	1~12 Digit
					1	0	1	1~13 Digit
					1	1	0	1~14 Digit
					1	1	1	1~15 Digit

5.2.6 ALL (70 Hex ~ 73 Hex) : All Segments ON/OFF

All segments can be display or non-displayed by using this command.

This command is useful for testing of VFD module, blinking of display or obviating erroneous display pattern at power on.

Table_17

b7	b6	b5	b4	b3	b2	b1	b0	Dimming Level
0	1	1	1	×	×	0	0	Maintain current state
						0	1	All Segs are OFF. (Default state)
						1	0	All Segs are ON.
						1	1	All Segs are ON(All ON is higher priority.)

5.3 Power On Reset

The reset function allows the users to re-initialize the display controller, while the power is still applied to the module, by applying a logical “0” to pin #10(/RST) of the connector,

when the controller is initialized, the display status are shown in Table_18.

Table_18

Content	After Power On
Display Characters	All Segments (16 digits * 35 dots) are “OFF”.
Comma and Decimal Point	All commas and Decimal Points are “OFF”.
Digit Length	Every Digit (1~16 digit) is usable.
Dimming Level	Set to 50%(8/16) Dimming.
Write-in Position	Write-in position is set to the first (Left End) Digit.
CG-RAM Data	Not defined.

6. OPERATING RECOMMENDATIONS

- 6.1 Avoid applying excessive shock or vibration beyond the specification for the VFD module.
- 6.2 Since VFDs are made of glass material, careful handling is required. I.e. Direct impact with hand material to the glass surface (especially exhaust tip) may crack the glass.
- 6.3 When mounting the VFD module to you system, leave a slight gap between the VFD glass and your front panel. The module should be mounted without stress to avoid flexing of the PCB.
- 6.4 Avoid plugging or unplugging the interface connection with the power on, otherwise it may cause the severe damage to input circuitry.
- 6.5 Slow starting power supply may cause non-operation because one chip micom won't be reset.
- 6.6 Exceeding any of maximum ratings may cause the permanent damage.
- 6.7 Since the VFD modules contain high voltage source, careful handling is required while power is on.
- 6.8 When the power is turned off, the capacitor does not discharge immediately. So the high voltage applied to VFD must not get in contact with ICs. In other words, short-circuit of mounted components on PCB within 30 seconds after power-off may cause damage the module.
- 6.9 The power supply must be capable of providing at least 3 times the rated current, because the surge current may be 3 times the specified current consumption when the power is turned on.
- 6.10 Avoid using the module where excessive noise interference is expected. Noise may affects the interface signal and causes improper operation. And it is important to keep the length of the interface cable less than 50cm.
- 6.11 Since all VFD modules contain C-MOS ICs, anti-static handling procedures are always required.

7. Reliability Condition

Item	Condition	Criteria	Remarks
High Temp. (Storage)	Temperature: $85 \pm 2^{\circ}\text{C}$ Duration : 72 hrs In unlighted state	Free of the Major Defects	Measurement shall be done after the specimens are kept at room temperature for an 24 hrs.
High Temp. (Operation)	Temperature: $70 \pm 2^{\circ}\text{C}$ Duration : 96 hrs In unlighted state		
Low Temp (Storage)	Temperature: $-40 \pm 2^{\circ}\text{C}$ Duration : 72 hrs In unlighted state		
Low Temp (Operation)	Temperature: $-20 \pm 2^{\circ}\text{C}$ Duration : 24hrs		
Temperature Cycling	 <p>Number of Repeating : 5 All Segments are lit.</p>		
Humidity (steady state)	Humidity : 90~95% Temperature : $40 \pm 2^{\circ}\text{C}$ Duration : 96hrs		
Vibration	Frequency : 10~55Hz Displacement : 1.5mm Direction: $\pm X, \pm Y, \pm Z$ Duration : 4 hrs (2 hrs for each direction) Condition: In unlighted state		

Item	Condition	Criteria	Remarks
Shock	G: 40G Time: 10ms Wave: Half sine wave Direction: $\pm X$, $\pm Y$, $\pm Z$ (3 times in each of the direction) Condition: In unlighted state	Free of the Major Defects	Measurement shall be done after the specimens are kept at room temperature for an 24 hrs.
Thermal Sock	 <p>Number of Repeating : 5 Unlighted state.</p>		

8. DESIGN CHANGE

8.1 NewHaven reserves the right to change the design of the VFD module without prior notice in order to improve the design and quality.
