Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

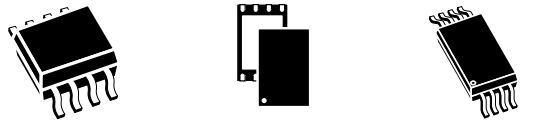
M24LR64E-R

Dynamic NFC/RFID tag IC with 64-Kbit EEPROM, energy harvesting, I²C bus and ISO 15693 RF interface

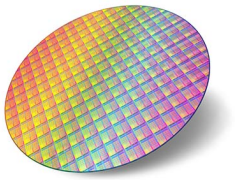
Datasheet - production data



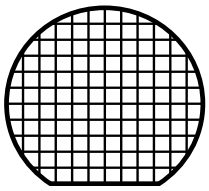
SO8 (MN)

UFDFPN8 (MC)
2 x 3 mm

TSSOP8 (DW)



Wafer (RUW20)



Wafer (SB12I)

Features

- Belonging to ST25 family, which includes all NFC/RF ID tag and reader products from ST

I²C interface

- Two-wires I²C serial interface supports 400 kHz protocol
- Single supply voltage:
  - 1.8 V to 5.5 V
- Byte and Page Write (up to 4 bytes)
- Random and Sequential read modes
- Self-timed programming cycle
- Automatic address incrementing
- Enhanced ESD/latch-up protection
- I²C timeout

Contactless interface

- ISO 15693 and ISO 18000-3 mode 1 compatible
- 13.56 MHz ± 7 kHz carrier frequency
- To tag: 10% or 100% ASK modulation using 1/4 (26 Kbit/s) or 1/256 (1.6 Kbit/s) pulse position coding
- From tag: load modulation using Manchester coding with 423 kHz and 484 kHz subcarriers in low (6.6 kbit/s) or high (26 kbit/s) data rate mode. Supports the 53 kbit/s data rate with Fast commands
- Internal tuning capacitance: 27.5 pF
- 64-bit unique identifier (UID)
- Read Block & Write (32-bit blocks)

Digital output pin

- User configurable pin: RF write in progress or RF busy mode

Energy harvesting

- Analog pin for energy harvesting
- Four sink current configurable ranges

Temperature range

- From –40 to 85 °C

Memory

- 64-Kbit EEPROM organized into:
  - 8192 bytes in I²C mode
  - 2048 blocks of 32 bits in RF mode
- Write time
  - I²C: 5 ms (max.)
  - RF: 5.75 ms including the internal Verify time
- Write cycling endurance:
  - 1 million write cycles at 25 °C
  - 150 k write cycles at 85 °C
- More than 40-year data retention
- Multiple password protection in RF mode
- Single password protection in I²C mode

Package

- SO8 (ECOPACK2®)
- TSSOP8 (ECOPACK2®)
- UFDFPN8 (ECOPACK2®)

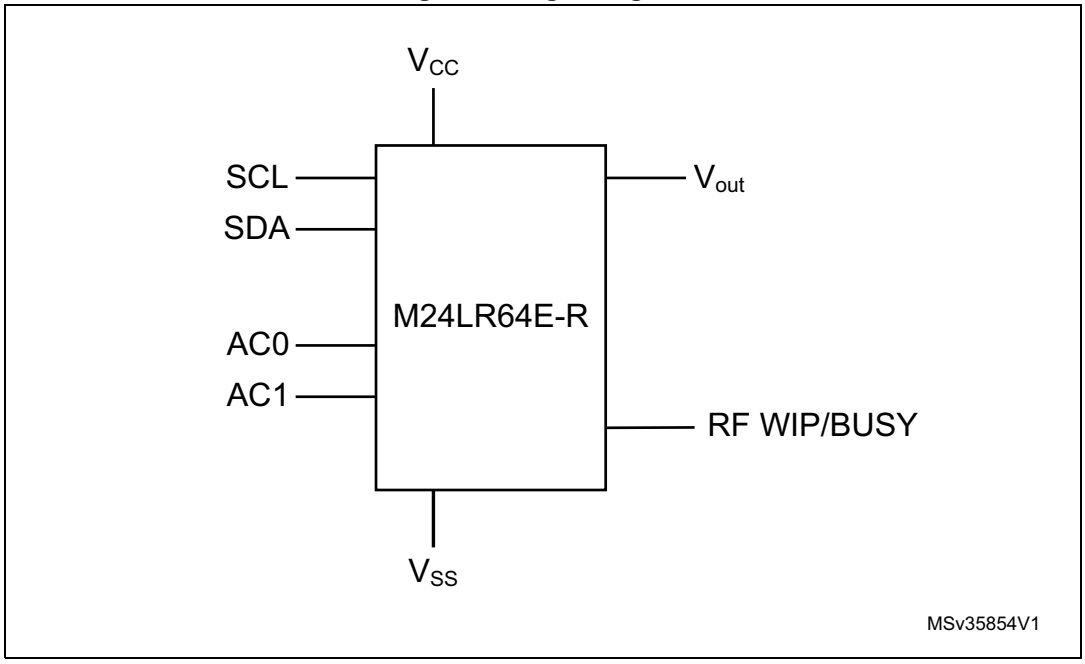
1 Description

The M24LR64E-R device is a Dynamic NFC/RFID tag IC with a dual-interface, electrically erasable programmable memory (EEPROM). It features an I^2C interface and can be operated from a V_{CC} power supply. It is also a contactless memory powered by the received carrier electromagnetic wave. The M24LR64E-R is organized as 8192 × 8 bits in the I^2C mode and as 2048 × 32 bits in the ISO 15693 and ISO 18000-3 mode 1 RF mode.

The M24LR64E-R also features an energy harvesting analog output, as well as a user-configurable digital output pin toggling during either RF write in progress or RF busy mode.

Figure 1. Logic diagram



I^2C uses a two-wire serial interface, comprising a bidirectional data line and a clock line. The devices carry a built-in 4-bit device type identifier code (1010) in accordance with the I^2C bus definition.

The device behaves as a slave in the I^2C protocol, with all memory operations synchronized by the serial clock. Read and Write operations are initiated by a Start condition, generated by the bus master. The Start condition is followed by a device select code and Read/Write bit ($\overline{RW}$) (as described in *Table 2*), terminated by an acknowledge bit.

When writing data to the memory, the device inserts an acknowledge bit during the 9^{th} bit time, following the bus master's 8-bit transmission. When data is read by the bus master, the bus master acknowledges the receipt of the data byte in the same way. Data transfers are terminated by a Stop condition after an Ack for Write, and after a NoAck for Read.

In the ISO15693/ISO18000-3 mode 1 RF mode, the M24LR64E-R is accessed via the 13.56 MHz carrier electromagnetic wave on which incoming data is demodulated from the received signal amplitude modulation (ASK: amplitude shift keying). When connected to an antenna, the operating power is derived from the RF energy and no external power supply is required. The received ASK wave is 10% or 100% modulated with a data rate of 1.6 Kbit/s

using the 1 out of 256 pulse coding mode or a data rate of 26 Kbit/s using the 1 out of 4 pulse coding mode.

Outgoing data is generated by the M24LR64E-R load variation using Manchester coding with one or two subcarrier frequencies at 423 kHz and 484 kHz. Data is transferred from the M24LR64E-R at 6.6 Kbit/s in low data rate mode and 26 Kbit/s in high data rate mode. The M24LR64E-R supports the 53 Kbit/s fast mode in high data rate mode using one subcarrier frequency at 423 kHz.

The M24LR64E-R follows the ISO 15693 and ISO 18000-3 mode 1 recommendation for radio-frequency power and signal interface.

The M24LR64E-R provides an Energy harvesting mode on the analog output pin Vout. When the Energy harvesting mode is activated, the M24LR64E-R can output the excess energy coming from the RF field on the Vout analog pin. In case the RF field strength is insufficient or when Energy harvesting mode is disabled, the analog output pin Vout goes into high-Z state and Energy harvesting mode is automatically stopped.

The M24LR64E-R features a user configurable digital out pin RF WIP/BUSY that can be used to drive a microcontroller interrupt input pin (available only when the M24LR64E-R is correctly powered on the Vcc pin).

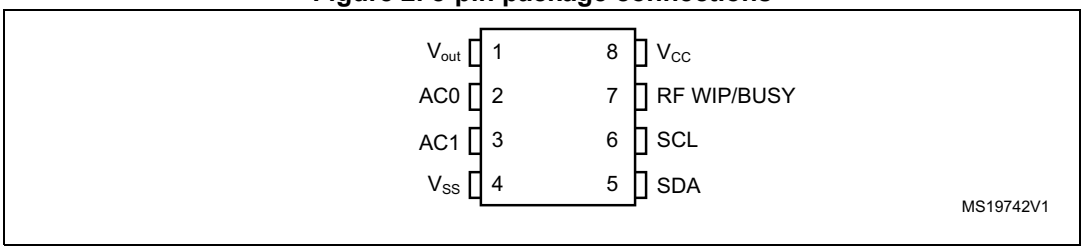
When configured in the RF write in progress mode (RF WIP mode), the RF WIP/BUSY pin is driven low for the entire duration of the RF internal write operation. When configured in the RF busy mode (RF BUSY mode), the RF WIP/BUSY pin is driven low for the entire duration of the RF command progress.

The RF WIP/BUSY pin is an open drain output and must be connected to a pull-up resistor.

Table 1. Signal names

Signal name	Function	Direction
Vout	Energy harvesting Output	Analog output
SDA	Serial Data	I/O
SCL	Serial Clock	Input
AC0, AC1	Antenna coils	I/O
V_{CC}	Supply voltage	-
RF WIP/BUSY	Digital signal	Digital output
V_{SS}	Ground	-

Figure 2. 8-pin package connections



1. See *Section 31* for package dimensions, and how to identify pin 1.

2 Signal descriptions

2.1 Serial clock (SCL)

This input signal is used to strobe all data in and out of the device. In applications where this signal is used by slave devices to synchronize the bus to a slower clock, the bus master must have an open drain output, and a pull-up resistor must be connected from Serial Clock (SCL) to V_{CC}. (*Figure 3* indicates how the value of the pull-up resistor can be calculated). In most applications, though, this method of synchronization is not employed, and so the pull-up resistor is not necessary, provided that the bus master has a push-pull (rather than open drain) output.

2.2 Serial data (SDA)

This bidirectional signal is used to transfer data in or out of the device. It is an open drain output that may be wire-OR'ed with other open drain or open collector signals on the bus. A pull-up resistor must be connected from Serial Data (SDA) to V_{CC}. (*Figure 3* indicates how the value of the pull-up resistor can be calculated).

2.3 RF Write in progress / RF Busy (RF WIP/BUSY)

This configurable output signal is used either to indicate that the M24LR64E-R is executing an internal write cycle from the RF channel or that an RF command is in progress. RF WIP and signals are available only when the M24LR64E-R is powered by the Vcc pin. It is an open drain output and a pull-up resistor must be connected from RF WIP/BUSY to V_{CC}.

2.4 Energy harvesting analog output (Vout)

This analog output pin is used to deliver the analog voltage Vout available when the Energy harvesting mode is enabled and the RF field strength is sufficient. When the Energy harvesting mode is disabled or the RF field strength is not sufficient, the energy harvesting analog voltage output Vout is in High-Z state.

2.5 Antenna coil (AC0, AC1)

These inputs are used to connect the device to an external coil exclusively. It is advised not to connect any other DC or AC path to AC0 or AC1.

When correctly tuned, the coil is used to power and access the device using the ISO 15693 and ISO 18000-3 mode 1 protocols.

2.5.1 Device reset in RF mode

To ensure a proper reset of the RF circuitry, the RF field must be turned off (100% modulation) for a minimum t_{RF_OFF} period of time.

2.6 V_{SS} ground

V_{SS} is the reference for the V_{CC} supply voltage and Vout analog output voltage.

2.7 Supply voltage (V_{CC})

This pin can be connected to an external DC supply voltage.

Note: An internal voltage regulator allows the external voltage applied on V_{CC} to supply the M24LR64E-R, while preventing the internal power supply (rectified RF waveforms) to output a DC voltage on the V_{CC} pin.

2.7.1 Operating supply voltage V_{CC}

Prior to selecting the memory and issuing instructions to it, a valid and stable V_{CC} voltage within the specified [V_{CC}(min), V_{CC}(max)] range must be applied (see *Table 119*). To maintain a stable DC supply voltage, it is recommended to decouple the V_{CC} line with a suitable capacitor (usually around 10 nF) close to the V_{CC}/V_{SS} package pins.

This voltage must remain stable and valid until the end of the transmission of the instruction and, for a Write instruction, until the completion of the internal I²C write cycle (t_W).

2.7.2 Power-up conditions

When the power supply is turned on, V_{CC} rises from V_{SS} to V_{CC}. The V_{CC} rise time must not vary faster than 1V/µs.

2.7.3 Device reset in I²C mode

In order to prevent inadvertent write operations during power-up, a power-on reset (POR) circuit is included. At power-up (continuous rise of V_{CC}), the device does not respond to any I²C instruction until V_{CC} has reached the power-on reset threshold voltage (this threshold is lower than the minimum V_{CC} operating voltage defined in *Table 119*). When V_{CC} passes over the POR threshold, the device is reset and enters the Standby power mode. However, the device must not be accessed until V_{CC} has reached a valid and stable V_{CC} voltage within the specified [V_{CC}(min), V_{CC}(max)] range.

In a similar way, during power-down (continuous decrease in V_{CC}), as soon as V_{CC} drops below the power-on reset threshold voltage, the device stops responding to any instruction sent to it.

2.7.4 Power-down conditions

During power-down (continuous decay of V_{CC}), the device must be in Standby power mode (mode reached after decoding a Stop condition, assuming that there is no internal write cycle in progress).

Table 2. Device select code

-	Device type identifier(1)				Chip Enable address			RW
	b7	b6	b5	b4	b3	b2	b1	b0
Device select code	1	0	1	0	E2(2)	1	1	RW

1. The most significant bit, b7, is sent first.
2. E2 is not connected to any external pin. It is however used to address the M24LR64E-R as described in *Section 3* and *Section 4*.

Table 3. Address most significant byte

b15	b14	b13	b12	b11	b10	b9	b8

Table 4. Address least significant byte

b7	b6	b5	b4	b3	b2	b1	b0

3 User memory organization

The M24LR64E-R is divided into 64 sectors of 32 blocks of 32 bits, as shown in *Table 5*. *Figure 6* shows the memory sector organization. Each sector can be individually read- and/or write-protected using a specific password command. Read and write operations are possible if the addressed data is not in a protected sector.

The M24LR64E-R also has a 64-bit block that is used to store the 64-bit unique identifier (UID). The UID is compliant with the ISO 15963 description, and its value is used during the anticollision sequence (Inventory). This block is not accessible by the user in RF device operation and its value is written by ST on the production line.

The M24LR64E-R includes an AFI register that stores the application family identifier, and a DSFID register that stores the data storage family identifier used in the anticollision algorithm.

The M24LR64E-R has four 32-bit blocks that store an I^2C password plus three RF password codes.

Figure 5. Circuit diagram

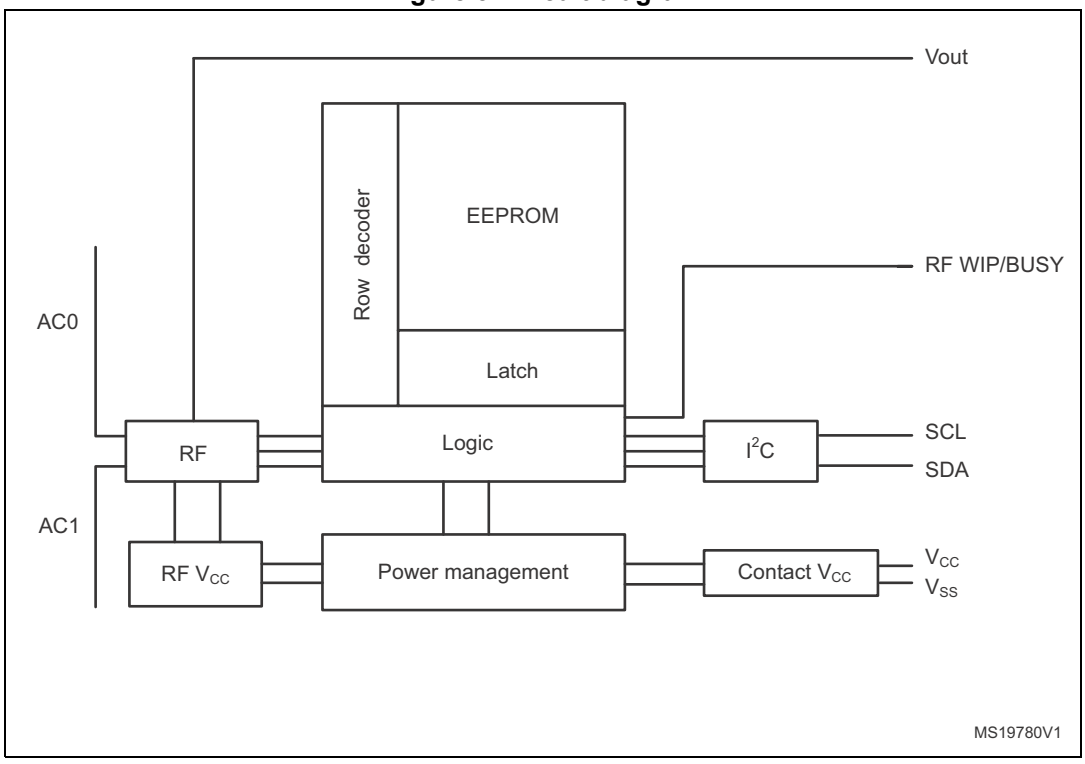

Figure 6. Memory sector organization

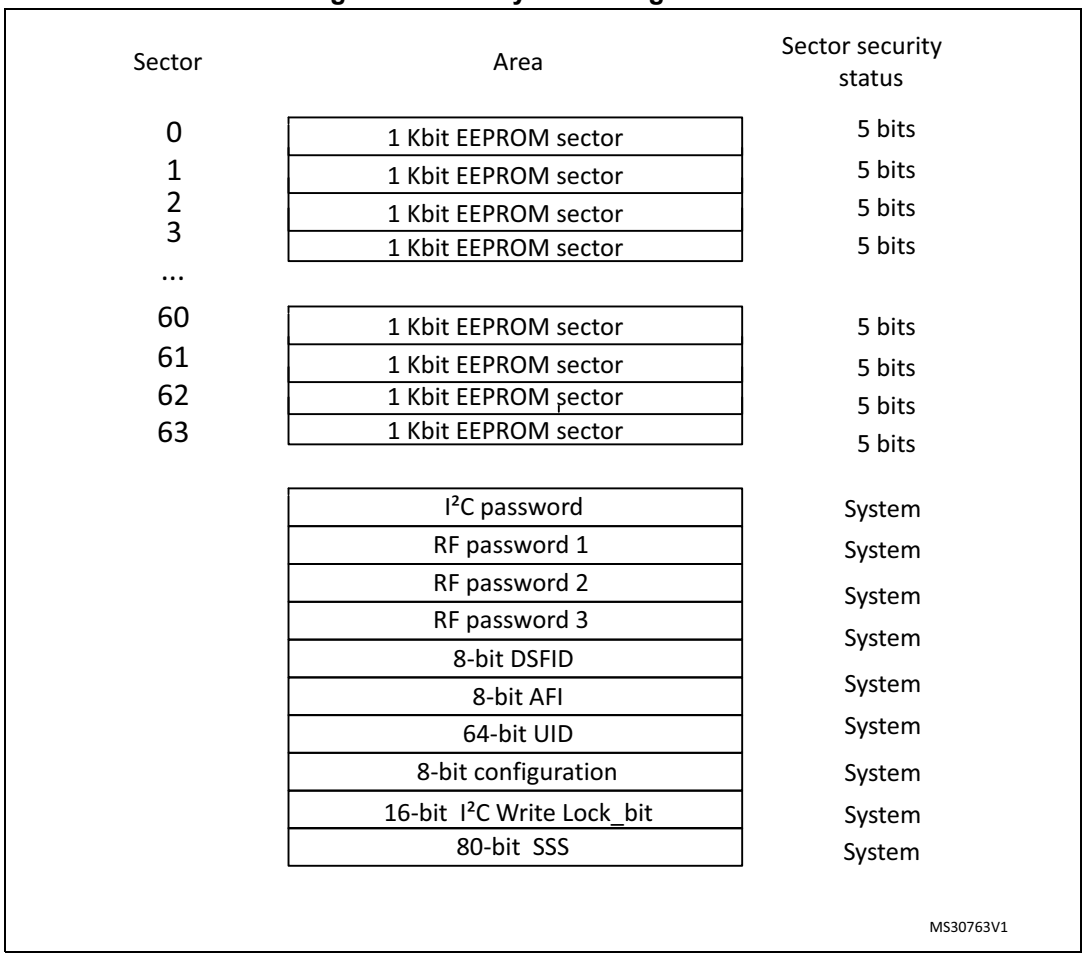

Sector details

The M24LR64E-R user memory is divided into 64 sectors. Each sector contains 1024 bits. The protection scheme is described in *Section 4: System memory area*.

In RF mode, a sector provides 32 blocks of 32 bits. Each read and write access is done by block. Read and write block accesses are controlled by a Sector Security Status byte that defines the access rights to the 32 blocks contained in the sector. If the sector is not protected, a Write command updates the complete 32 bits of the selected block.

In I^2C mode, a sector provides 128 bytes that can be individually accessed in Read and Write modes. When protected by the corresponding I2C_Write_Lock bit, the entire sector is write-protected. To access the user memory, the device select code used for any I^2C command must have the E2 Chip Enable address at 0.

4 System memory area

4.1 M24LR64E-R block security in RF mode

The M24LR64E-R provides a special protection mechanism based on passwords. In RF mode, each memory sector of the M24LR64E-R can be individually protected by one out of three available passwords, and each sector can also have Read/Write access conditions set.

Each memory sector of the M24LR64E-R is assigned with a Sector security status byte including a Sector Lock bit, two Password Control bits and two Read/Write protection bits, as shown in *Table 7*.

Table 6 describes the organization of the Sector security status byte, which can be read using the Read Single Block and Read Multiple Block commands with the Option_flag set to 1.

On delivery, the default value of the SSS bytes is set to 00h.

Table 6. Sector security status byte area

I^2C byte address		Bits [31:24]	Bits [23:16]	Bits [15:8]	Bits [7:0]
E2 = 1	0	SSS 3	SSS 2	SSS 1	SSS 0
E2 = 1	4	SSS 7	SSS 6	SSS 5	SSS 4
E2 = 1	8	SSS 11	SSS 10	SSS 9	SSS 8
E2 = 1	12	SSS 15	SSS 14	SSS 13	SSS 12
E2 = 1	16	SSS 19	SSS 18	SSS 17	SSS 16
E2 = 1	20	SSS 23	SSS 22	SSS 21	SSS 20
E2 = 1	24	SSS 27	SSS 26	SSS 25	SSS 24
E2 = 1	28	SSS 31	SSS 30	SSS 29	SSS 28
E2 = 1	32	SSS 35	SSS 34	SSS 33	SSS 32

E2 = 1	56	SSS 59	SSS 58	SSS 57	SSS 56
E2 = 1	60	SSS 63	SSS 62	SSS 61	SSS 60

Table 7. Sector security status byte organization

b_7	b_6	b_5	b_4	b_3	b_2	b_1	b_0
0	0	0	Password control bits		Read / Write protection bits		Sector Lock

When the Sector Lock bit is set to 1, for instance by issuing a Lock-sector command, the two Read/Write protection bits (b_1, b_2) are used to set the Read/Write access of the sector as described in *Table 8*.

Table 8. Read/Write protection bit setting

Sector Lock	b_2, b_1	Sector access when password presented		Sector access when password not presented	
0	xx	Read	Write	Read	Write
1	00	Read	Write	Read	No Write
1	01	Read	Write	Read	Write
1	10	Read	Write	No Read	No Write
1	11	Read	No Write	No Read	No Write

The next two bits of the Sector security status byte (b_3, b_4) are the password control bits. The value of these two bits is used to link a password to the sector, as defined in *Table 9*.

Table 9. Password control bits

b_4, b_3	Password
00	The sector is not protected by a password.
01	The sector is protected by password 1.
10	The sector is protected by password 2.
11	The sector is protected by password 3.

The M24LR64E-R password protection is organized around a dedicated set of commands, plus a system area of three password blocks where the password values are stored. This system area is described in *Table 10*.

Table 10. Password system area

Add	Password
1	Password 1
2	Password 2
3	Password 3

The dedicated commands for protection in RF mode are:

- Write-sector password:

  The Write-sector password command is used to write a 32-bit block into the password system area. This command must be used to update password values. After the write cycle, the new password value is automatically activated. It is possible to modify a password value after issuing a valid Present-sector password command. On delivery, the three default password values are set to 0000 0000h and are activated.

- Lock-sector:

  The Lock-sector command is used to set the sector security status byte of the selected sector. Bits b_4 to b_1 of the sector security status byte are affected by the Lock-sector
