Description

The MAGX-000035-01500X is a gold-metalized unmatched Gallium Nitride (GaN) on Silicon Carbide RF power transistor suitable for a variety of RF power amplifier applications. Using state of the art wafer fabrication processes, these high performance transistors provide high gain, efficiency, bandwidth, and ruggedness over multiple octave bandwidths for today's demanding application needs.

The MAGX-000035-01500X is constructed using a thermally enhanced flanged (Cu/W) or flangeless (Cu) ceramic package which provides excellent thermal performance. High breakdown voltages allow for reliable and stable operation in extreme mismatched load conditions unparalleled with older semiconductor technologies.

Correct Device Sequencing

Turning the device ON

1. Set V_{GS} to the pinch-off (V_P), typically -5 V.
2. Turn on V_{DS} to nominal voltage (+50V).
3. Increase V_{GS} until the I_{DS} current is reached.
4. Apply RF power to desired level.

Turning the device OFF

1. Turn the RF power off.
2. Decrease V_{GS} down to V_P.
3. Decrease V_{DS} down to 0 V.
4. Turn off V_{GS}.

2. Operation of this device above any one of these parameters may cause permanent damage.
3. Channel temperature directly affects a device's MTTF. Channel temperature should be kept as low as possible to maximize lifetime.
4. For saturated performance it is recommended that the sum of $(3 \cdot V_{DD} + \text{abs}(V_{GG})) < 175 \text{ V}$.
5. Junction Temperature (T_J) = $T_C + \theta_{JC} \cdot ((V \cdot I) - (P_{OUT} - P_{IN}))$

Typical transient thermal resistances:

1 ms pulse, 10% duty cycle, $\theta_{JC} = 5.0^\circ\text{C/W}$

For $T_C = 85^\circ\text{C}$,

$T_J = 132^\circ\text{C}$ @ 50 V, 520 mA-pk, $P_{OUT} = 17.0 \text{ W}$, $P_{IN} = 0.5 \text{ W}$
