

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Evaluates: MAX11253/MAX11254

General Description

The MAX11253/MAX11254 evaluation kit (EV kit) provides a proven design to evaluate the MAX11253/MAX11254 family of 16-bit/24-bit, 6-channel, 64ksps, integrated PGA delta-sigma ADCs. The EV kit includes a graphical user interface (GUI) that provides communication from the target device to the PC. The EV kit can operate in multiple modes:

- Standalone Mode: in "standalone" mode, the EV kit is connected to the PC via a USB cable and performs a subset of the complete EV kit functions with limitations for sample rate, sample size, and no support for coherent sampling.
- 2) FPGA Mode: in "FPGA" mode, the EV kit is connected to an Avnet ZedBoard™ through a low-pin-count FMC connector. ZedBoard features a Xilinx® Zynq® -7000 SoC, which connects to the PC through an Ethernet port, allowing the GUI to perform different operations with full control over mezzanine card functions. The EV kit with FPGA platform performs the complete suite of evaluation tests for the target IC.
- 3) **User-Supplied SPI Mode:** In addition to the USB and FMC interfaces, the EV kit provides a 12-pin Pmod™-style header for user-supplied SPI interface to connect the signals for SCLK, DIN, DOUT, and CNVST.

The EV kit includes Windows XP®, Windows® 7, and Windows 8.1-compatible software for exercising the features of the IC. The EV kit GUI allows different sample sizes, adjustable sampling rates, internal or external reference options, and graphing software that includes the FFT and histogram of the sampled signals.

The ZedBoard accepts a +12V AC-DC wall adapter. The EV kit can be powered by a local +12V supply. The EV kit has on-board transformers and digital isolators to separate the IC from the ZedBoard/on-board processor.

The MAX11253/MAX11254 EV kit comes installed with a MAX11253ATJ+ or MAX11254ATJ+ in a 32-pin TQFN-EP package.

Features and Benefits

- High-Speed USB Connector, FMC Connector, and Pmod-Style Connector
- 8MHz SPI Clock Capability through FMC Connector
- 8MHz SPI Clock Capability in Standalone Mode
- Various Sample Sizes and Sample Rates
- Collects Up to 1 Million Samples (with FPGA Platform)
- Time Domain, Frequency Domain, and Histogram Plotting
- Sync In and Sync Out for Coherent Sampling (with FPGA Platform)
- On-Board Input Buffers: MAX9632 and MAX44205 (Fully Differential)
- On-Board Voltage References (MAX6126 and MAX6070)
- Proven PCB Layout
- Fully Assembled and Tested
- Windows XP-, Windows 7-, and Windows 8.1-Compatible Software

Ordering Information appears at end of data sheet.

Quick Start

Required Equipment

- MAX11253/MAX11254 EV kit
- +12V (500mA) power supply
- Micro-USB cable
- ZedBoard FPGA platform (optional – <u>NOT INCLUDED</u> with EVKit)
- Function generator (optional)
- Windows XP, Windows 7, or Windows 8.1 PC with a spare USB port

Note: In the following section(s), software-related items are identified by bolding. Text in **bold** refers to items directly from the EV system software. Text in **bold and underline** refers to items from the Windows operating system.

Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation:

- Visit http://www.maximintegrated.com/evkitsoft-ware to download the latest version of the EV kit software, MAX11253_54EVKITSetupV1.0.zip. Save the EV kit software to a temporary folder and uncompress the ZIP file.
- 2) Install the EV kit software and USB driver on your computer by running the MAX11253_54EVKitSetupV1.0.exe program inside the temporary folder. The program files are copied to your PC and icons are created in the Windows <u>Start | Programs</u> menu. At the end of the installation process the installer will launch the installer for the FTDIChip CDM drivers.

Evaluates: MAX11253/MAX11254

For Standalone mode:

- 1) Verify that all jumpers are in their default positions for the EV kit board (Table 2).
- Connect the PC to the EV kit using a micro-USB cable
- 3) Connect the +12V adapter to the EV kit.
- 4) Start the EV kit software by opening its icon in the <u>Start | Programs</u> menu. The EV kit software appears as shown in <u>Figure 1</u>. From the <u>Device</u> menu select <u>Standalone</u>. Verify that the lower left status bar indicates the EV Kit hardware is <u>Connected</u>.

For FPGA mode (when connected to a Zedboard):

- Connect the Ethernet cable from the PC to the Zed-Board and configure the Internet Protocol Version 4 (TCP/Ipv4) properties in the local area connection to IP address 192.168.1.2 and subnet Mask to 255.255.255.0.
- 2) Verify that the ZedBoard SD card contains the Boot. bin file for the MAX11253/MAX11254 EV kit.
- 3) Connect the EV kit FMC connector to the ZedBoard FMC connector. Gently press them together.
- 4) Verify that all jumpers are in their default positions for the ZedBoard (Table 1) and EV kit board (Table 2).
- 5) Connect the 12V power supply to the ZedBoard. Leave the Zedboard powered off.
- 6) Enable the ZedBoard power supply by sliding SW8 to ON and connect the +12V adapter to the EV kit.

7) Start the EV kit software by opening its icon in the <u>Start | Programs</u> menu. The EV kit software appears as shown in <u>Figure 1</u>. From the <u>Device</u> menu select <u>FPGA</u>. Verify that the lower left status bar indicates the EV Kit hardware is <u>Connected</u>.

For Either Standalone or FPGA Mode:

- Connect the positive terminal of the function generator to the AIN0D+ (TP1) test point on the EV kit. Connect the negative terminal of the function generator to the AIN0D- (TP2) test point on the EV kit.
- 2) Configure the signal source to generate a 100Hz, $1V_{P-P}$ sinusoidal wave with +1V offset.
- 3) Turn on the function generator.
- 4) In the Device menu, choose either standalone or the FPGA option. In the configuration group, select Channel 0 and click Convert in the serial interface menu.
- 5) Click on the Scope tab.
- 6) Check the **Remove DC Offset** checkbox to remove the DC component of the sampled data.
- 7) Click the **Capture** button to start the data analysis.
- 8) The EV kit software appears as shown in Figure 1.
- Verify that the frequency, which is displayed on the right, is approximately 100Hz. The scope image has buttons in the upper right corner that allow zooming in to detail.

	5-6*	Use on-board -12V from U33 LDO as VEE	

^{*}Default configuration

Evaluates: MAX11253/MAX11254

General Description of Software

The main window of the EV kit software contains seven tabs: Configuration, Scope, DMM, Histogram, FFT, Scan Mode, and Registers. The Configuration tab provides control for the ADC configuration including calibration and data capture. The other six tabs are used for evaluating the data captured by the ADC.

Configuration Tab

The Configuration tab provides an interface for selecting and configuring the ADC from a functional perspective. Select the desired **Device** for either Standalone or FPGA in the dropdown menu and the corresponding properties of the device are displayed including Channel number, Sample Rate, Number of Samples, Reference Voltage, Sequencing Mode, Calibration, GPO/GPIO selection, Input Path (Direct or internal PGA), Delta-Sigma Modulator type selection for different Data Format and Conversion Mode, Serial Interface function (Convert, and Read All), Power setting (NOP, Power Down, and Standby), Reset Registers, and RSTB Reset, Clock/ SYNC (Internal or External Clock, and Disable or Enable SYNC Mode), and Other for Disable or Enable Current Sink/Source and CAPREG LDO.

The sample settings are available on the left of the configuration menu, which allow the user to select the Channel, Sample Rate, Number of Samples and Clock Source if FPGA device is used.

The Read Data and Status information is displayed on the right, which shows the data in both voltage and Hex, the sample rate, and power state for the selected channel. In addition, if there are any errors, the indicator lights will turn red.

Channel Selection

To select the desired channel among the six available channels, click Channel # dropdown menu at the top left and select the desired channel from 0 to 5. The default selection is Channel 0.

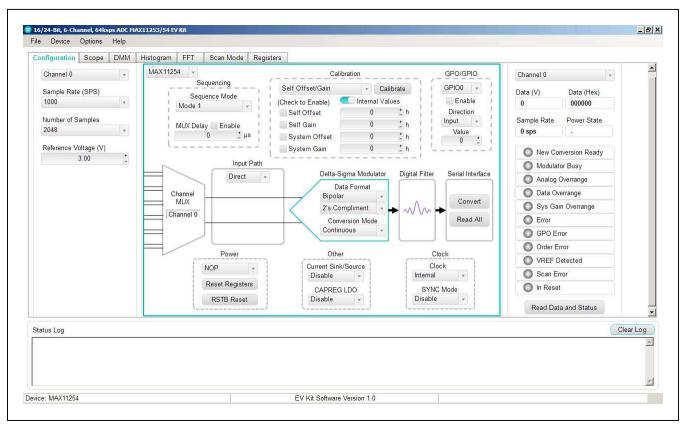

Figure 1. EV Kit Software (Configuration Tab)

Sample Rate (SPS)

To select the desired data rate for single-cycle mode from 50sps to 12800sps and for continuous mode data rate from 1.9sps to 64000sps, choose the **Sample Rate (SPS)** from the dropdown menu below the **Channel #** selection.

Reference Voltage

There are three different reference voltages available on board: MAX6070AUT18+ (1.8V), MAX6070AUT30+ (3.0V), and MAX6126AASA30+ (3.0V). To select 1.8V, place JMP1 from position 1 to 4. To select 3.0V MAX6070 with $\pm 0.04\%$ accuracy, place JMP1 from position 1 to 3. To select 3.0V MAX6126 with $\pm 0.02\%$ accuracy, place JMP1 from position 1 to 2.

Sequencer Mode

To change the sequencer mode, click the **Sequence Mode** selection below the **Sequencing** menu and select Mode 1, 2, or 3 as desired. Check the **GPO Sequencer Mode** box to enable GPO/GPIO function in mode 3. In addition, check the Enable box to enable the **MUX and GPO Delay**. Choose the desired delay in microseconds by clicking on the + or – buttons.

ADC Calibration

Two types of software calibration for offset and gain are available: Self calibration and system calibration.

The primary mode for calibration is using the dropdown list to select a calibration mode, followed by clicking the Calibrate button. The checkboxes for Self Offset, Self Gain, System Offset, and System Gain allow for the user to enable or disable the calibration values. The calibration values can also be changed manually by entering a hex value in the numeric box.

GPO/GPIO

To select GPO or GPIO ports, choose the option under the **GPO/GPIO** dropdown menu and check the **Enable** box.

Input Path

Select **Direct** under the **Input Path** dropdown menu to bypass the internal amplifiers and apply the analog input signals directly to the MAX11253/MAX11254 inputs or to use the external amplifiers.

Select **PGA** under the **Input Path** dropdown menu to use the internal programmable gain amplifiers.

Delta-Sigma Modulator

To select the desired data format, click the **Data Format** dropdown menu under the **Delta-Sigma Modulator** section and choose either Bipolar or Unipolar with two's complement or offset binary options.

Three conversion modes are provided: Continuous, Single Cycle, and Single Continuous. Click the Conversion Modes dropdown menu under the Delta-Sigma Modulator section to select the desired conversion mode.

Evaluates: MAX11253/MAX11254

Serial Interface

To starting converting, click the **Convert** button under the Serial interface section. To read all registers, click the **Read All** button.

Power

The MAX11253/MAX11254 EV kit features three power-down states: **Normal Operating Power (NOP)**, **Power down**, **and Standby**. Select the desired power state by clicking the drop-down menu under the **Power** section.

To reset the configuration settings back to default values, press the **Reset Registers** button.

To exercise the power-on reset feature, click the **RSTB** button.

Clock/SYNC

The internal clock mode is set at default condition. To use the external clock provided on-board, select **External** under the **Clock/SYNC** section and install jumper J11 from 2-3. To user-supplied external clock, select External under the **Clock/SYNC** section and install jumper J11 from 1-2. In addition, the Sync mode can be enabled or disabled by clicking the drop-down menu under this **Clock/SYNC** section and install jumper J15. The Sync signal should be provided externally.

Other

To enable (J14 open) or disable (J14 installed and $V_{DDVD} \le 2.0V$) the internal **CAPREG LDO** for digital and I/O supply, select this option from the drop-down menu under the **Other** section. Additionally, **Current Sink/Source** can also be disabled or enabled under this section.

Read Data and Status

The **Read Data and Status** on the far right hand side of this **Configuration** menu depicts the received data and status of the device such as the selected channel, data rate, sample rate, and power state. Click the **Read Data and** Status button to view the updated status.

To save a configuration, select Save ADC Config As... in the File menu. This saves all the ADC register values to a XML file. To load a configuration, select Load ADC Config in the File menu. When the XML file is loaded, all the register values in the file are written to the ADC.

Evaluates: MAX11253/MAX11254

Scope Tab

The Scope tab sheet is used to capture data and display it in the time domain. The desired **Channel #**, **Sample Rate**, **Number of Samples**, **Display Unit**, **Average Samples**, and **Resolution Selection** can also be set in this tab if they were not appropriately adjusted in other tabs. The **Display Unit** drop-down list allows counts in LSB and voltages in V, mV, or μ V. Once the desired configuration is

set, click on the **Capture** button. The right side of the tab sheet displays details of the waveform, such as average, standard deviation, maximum, minimum, and fundamental frequency as shown in Figure 2.

To save the captured data to a file, select **Options > Save Graph > Scope**. This saves the setting on the left and the data captured to a CSV file.

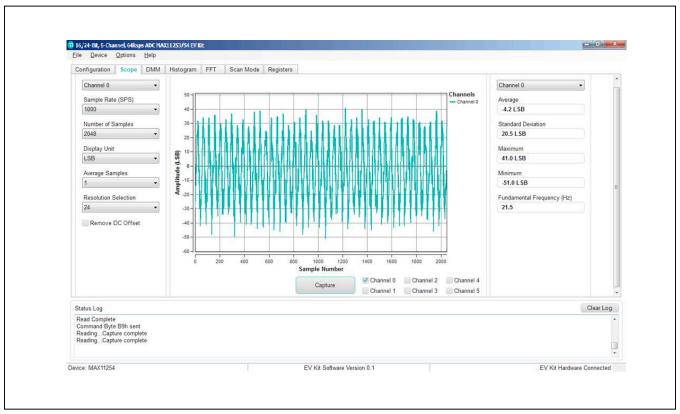

Figure 2. EV Kit Software (ScopeTab)

Evaluates: MAX11253/MAX11254

DMM Tab

The **DMM** tab sheet provides the typical information as a digital multimeter. Once the desired configuration is set,

click on the **Capture** button. Figure 3 displays the results shown by the **DMM** tab when a 1.5V signal is applied to AIN0+ and 1.0V to AIN0-.

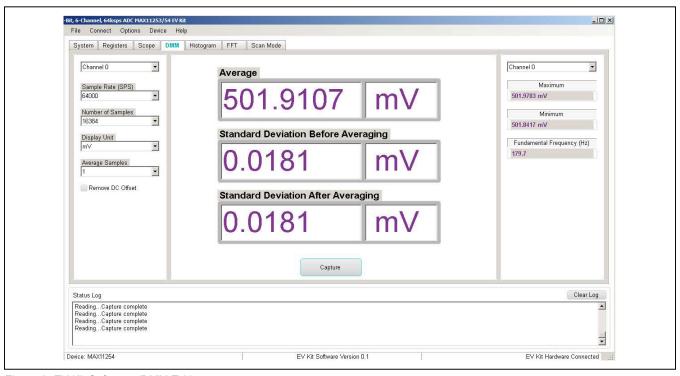

Figure 3. EV Kit Software (DMM Tab)

Evaluates: MAX11253/MAX11254

Histogram Tab

The **Histogram** tab sheet is used to show the histogram of the data. Sample rate and number of samples can also be set in this tab if they were not appropriately adjusted in other tabs. Once the desired configuration is set, click on the **Capture** button. The right side of the tab sheet displays details of the histogram such as average, standard deviation, maximum, minimum, peak-to-peak noise, effective resolution, and noise-free resolution as shown in Figure 4.

The histogram tab is enabled at default. Using the histogram will slow down the GUI response. To disable it, check the **Disable Histogram** box.

To save the histogram data to a file, go to **Options > Save Graph > Histogram**. This saves the setting on the left and the histogram data captured to a CSV file.

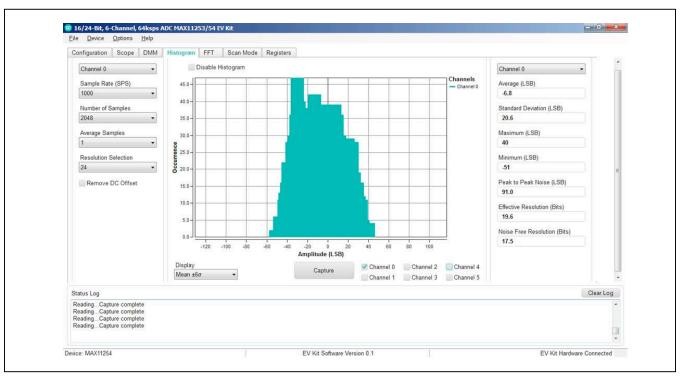

Figure 4. EV Kit Software (Histogram Tab)

Evaluates: MAX11253/MAX11254

FFT Tab

The FFT tab sheet is used to display the FFT of the data. The Sample Rate, Number of Samples, Resolution and Window Function type can be set as desired. To calculate the Adjusted Input Signal frequency for Coherent Sampling, enter the Input Signal frequency in Hertz and push the Calculate button. Once the preferred configuration is set, click on the Capture button. The right side of the tab displays the performance based on the FFT, such as fundamental frequency, SNR, SINAD, THD, SFDR, ENOB, and Noise Floor as shown in Figure 5.

To save the FFT data to a file, go to **Options > Save Graph > FFT**. This saves the setting on the left and the FFT data captured to a CSV file.

When coherent sampling is needed, this tab allows the user to calculate the external clock frequency applied to the board. Adjust the input frequency of the low-jitter clock to the value as shown in the **Adjusted Master Clock (Hz)** and apply it to the EV KIT EXT_CLK connector. See the <u>Sync Input and Sync Output</u> section before using this feature.

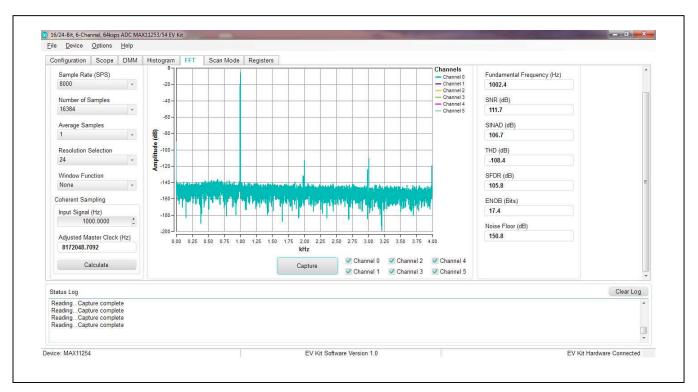

Figure 5. EV Kit Software (FFT Tab)

Evaluates: MAX11253/MAX11254

<u>Figure 6</u> shows the setup Maxim Integrated uses to capture data for coherent sampling.

For coherent FFT evaluation, use the jumper settings from $\underline{\text{Table 2}}$ for proper configurations. The low-jitter clock is synchronized with the signal generator at 10MHz from the ZedBoard. To achieve coherent sampling, click on the

Calculate button and enter the Adjusted Master Clock (Hz) frequency of approximately 8.192MHz into our low-jitter clock. Timing for all SPI timing and sampling rate are based off the system clock.

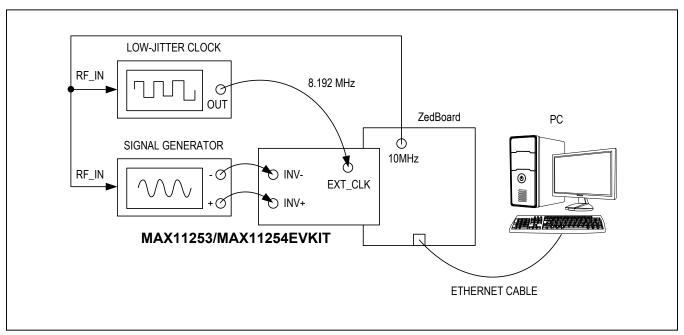

Figure 6. EV Kit Coherent Sampling Setup

Evaluates: MAX11253/MAX11254

Scan Mode Tab

The **Scan Mode** tab is used to perform selected data conversions and read the converted data.

In the **Sequence Setting** section at the bottom, set the desired sequencer mode (1 to 3) from the **Sequence Mode** drop-down menu and select whether to assert the RDYB pin **after one channel** or **after scan completes** options under the **RDYB** menu. Check the **GPO Sequencer Mode** and **Enable** boxes as desired. Then set the conversion time delay in µs for MUX and GPO by clicking on the + or - buttons under the **MUX Delay** and **GPO Delay** menu, allowing for high impedance source networks to stabilize after the channels are selected. Finally press the **Read All button** to view the selected settings.

In the **Read Data** section on top, select the desired unit in either LSB or voltage (V, mV, or μ V) under the **Display Unit** drop-down menu. Then choose the desired sample rate by clicking on the **Sample Rate** drop-down menu under. Finally, click the Scan button to start converting and press the **Read Data** button to view the converted data displayed on the right hand side as shown in Figure 7.

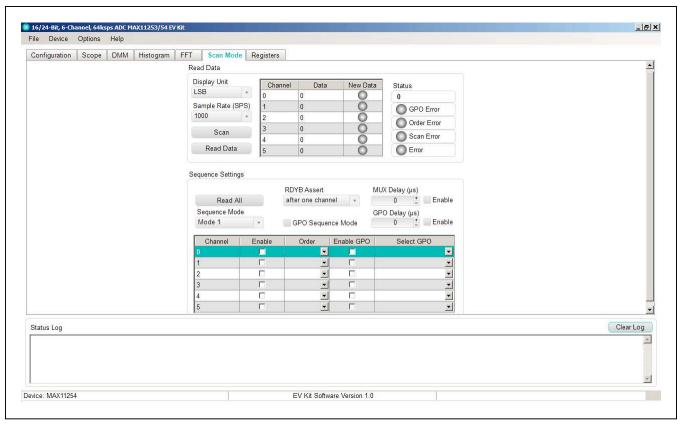

Figure 7. EV Kit Software (Scan Mode Tab)

Evaluates: MAX11253/MAX11254

ADC Registers Tab

The **Registers** tab sheet shows the device registers on the left. The middle section shows the descriptions of the selected register. Click **Read All** to read all registers and refresh the window with the register settings. To write a register first select the hex value in the **Value** column, type the desired hex value and press **Enter**.

The command byte is on the right side of the tab sheet. This byte precedes all SPI transactions and is described in the IC datasheet. To send a command byte enter a hex value in the numeric box and click the **Send** button. The command byte has two different formats including **Conversion Command** and **Register Read/Write**. Select the radio button for the desired mode to see the bit description in the table. See Figure 8.

Detailed Description of Hardware

The MAX11253/MAX11254 EV kit provides a proven signal path and board layout to demonstrate the performance of the MAX11253/MAX11254 16-/24-bit, delta-sigma ADCs. Included in the EV kit are digital isolators, isolated DC-DC converters, ultra-low-noise LDOs to all supply pins of the IC, on-board reference (MAX6126 and MAX6070), precision amplifiers (MAX9632 and MAX44205) for analog inputs, and sync-in and sync-out signals for coherent sampling.

An on-board FTDI controller is provided to allow for evaluation in standalone mode, which has limitations on maximum sample speed and on sample depth. The EV kit can be used with FPGA to achieve full speed and a larger sample depth.

The EV kit supports a number of different devices as listed in Table 3.

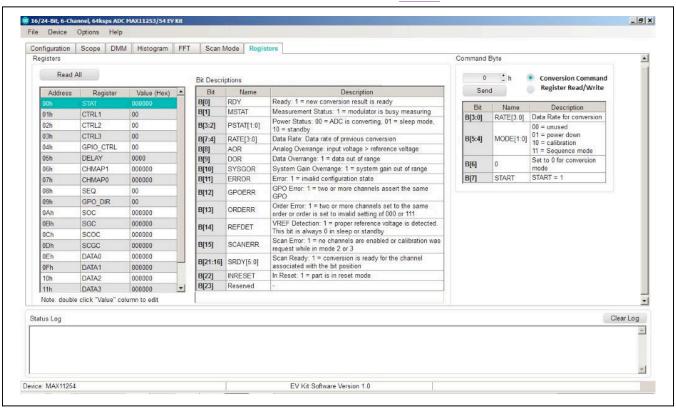

Figure 8. EV Kit Software (ADC Registers Tab)

Table 3. Products Supported with MAX11253/MAX11254 EV Kit

PART NO.	RESOLUTION	MAX. SAMPLE RATE
MAX11253	16-bits	64ksps
MAX11254	24-bits	64ksps

User-Supplied SPI

To evaluate the EV kit with a user-supplied SPI bus, disconnect from the FMC bus and remove jumper J64. Apply the user-supplied SPI signals to SCLK, CSB, DIN, and DOUT at the PMOD_A header (J60). Make sure the return ground is connected to PMOD ground.

The on-board FTDI chip used for standalone mode does not conflict with the user-supplied SPI if it is powered off by removing jumper J64.

CAUTION: DO NOT PLUG THIS HEADER INTO A STANDARD PMOD INTERFACE FOUND ON OTHER FPGA OR MICROCONTROLLER PRODUCTS. THE SIGNAL DEFINITION IS UNIQUE TO THIS EV KIT.

FMC Interface:

The users should confirm compatibility of pin-usage between their own FMC implementation and that of the Maxim Integrated EV kit before connecting the Maxim Integrated EV kit to a different system with FMC connectors.

Voltage References

There are three different reference voltages available on board: MAX6070AUT18+ (1.8V), MAX6070AUT30+ (3.0V), and MAX6126AASA30+ (3.0V). To select 1.8V, place JMP1 from position 1 to 4. To select 3.0V MAX6070 with $\pm 0.04\%$ accuracy, place JUMP1 from position 1 to 3. To select 3.0V MAX6126 with $\pm 0.02\%$ accuracy, place JMP1 from position 1 to 2.

For user-supplied external references, remove jumper J24 and connect a reference voltage to J24-2. Measure and enter the value of the external reference voltage into the **Reference Voltage** edit box on the **Configuration** tab of the GUI. Table 3 depicts the reference source options.

External DVDD Power Supply

The internal 1.8V regulator can be replaced by an external supply in the range of 1.7V to 2.0V. To use external DVDD, **disable** the internal regulator by selecting the Disable in the **CAPREG LDO** drop-down menu in the Other section and install J14.

User-Supplied Power Supply

The EV kit receives power from a single DC source of 12V, 500mA through a J61 power jack. The MAX13256, H-bridge driver and transformer create an additional negative rail for +15V and -15V. The power is then rectified and regulated down to a +12V and -12V supplies for the MAX9632 op amps, as well as +5V and -5V supplies for the MAX44205 op amps. Additional supplies are generated for +1.8V/-1.8V and +2V/+3.3V for the ADCs and VREFs. See the EV kit schematic pdf for details. Specific

voltages can be connected to the board for each rail, see Table 4 for corresponding jumper positions.

Evaluates: MAX11253/MAX11254

ADC Input Amplifiers

The input amplifiers allow for significant flexibility, supporting bipolar or unipolar input paths, as well as the option for gain control. Selected input amplifiers can be configured as inverting, noninverting, differential bipolar, and differential unipolar. See <u>Table 5</u> for these analog input configurations for channels 0 to 5.

The analog front-end consists of six channels, 0 to 5, and there are four user-selectable input pairs (for example AINx+ and AINx- where x is 2, 3, 4 or 5) allowing selection between one of two op amp solutions, the MAX9632 a 36V, precision, low-noise, wide-band amplifier or the MAX44205, a 180MHz, low-noise, low-distortion, fully differential op amp. The op amps can be configured as inverting or noninverting amplifiers by jumper selectors. Both op amps work as anti-aliasing lowpass filters (LPF) and can be daisy-chained to create a second-order LPF.

The range of possible configurations are listed in Table 5.

Sync Input and Sync Output (For Coherent Sampling)

Sync Input and Sync Output is applicable to the FPGA (ZedBoard) and is not used in Standalone mode. The SYNC_IN SMA accepts an approximate 100MHz waveform signal to generate the system clock of the ZedBoard. For maximum performance, use a low-jitter clock that syncs to the user's analog function generator. The SYNC_OUT SMA outputs a 10MHz square waveform that syncs to the user's analog function generator. Both options are used for coherent sampling of the IC. Use only one option at a time. The relationship between $f_{\mbox{\footnotesize{IN}}}$, $f_{\mbox{\footnotesize{S}}}$, $f_{\mbox{\footnotesize{NCYCLES}}}$, and $f_{\mbox{\footnotesize{MSAMPLES}}}$ is given as follows:

$$\frac{f_{IN}}{f_{S}} = \frac{N_{CYCLES}}{M_{SAMPLES}}$$

where:

f_{IN} = Input frequency

f_S = Sampling frequency

N_{CYCLES} = Prime number of cycles in the sampled set M_{SAMPLES} = Total number of samples

Ordering Information

PART	TYPE		
MAX11253EVKIT#	EVKIT		
MAX11254EVKIT#	EVKIT		

#Denotes RoHS compliant.

Contact Avnet to purchase a ZedBoard to communicate with the MAX11253/MAX11254 EV kit.

This EV kit comes with two assembly options:

The MAX11253EVKIT# comes with a MAX11253ATJ+ in a 32-pin TQFN package.

The MAX11254EVKIT# comes with a MAX11254ATJ+ in a 32-pin TQFN package..

Both EV kit variations use the same PCB and bill of materials, and the only variation is the IC assembled at U1.
