

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

MAX149X1 Evaluation Kit

**Evaluates: MAX14938/MAX14939/
MAX14941/MAX14942/
MAX14945/MAX14948**

General Description

The MAX149X1 evaluation kit (EV kit) is a fully assembled and tested PCB that demonstrates the functionality of the MAX14938 isolated RS-485/Profibus™ transceiver. The EV kit operates from a single 3.3V supply and features an on-board isolated power supply to power the secondary-side of the circuit.

The MAX149X1 EV kit can also be used to evaluate the MAX14939, MAX14941, MAX14942, MAX14945, and MAX14948.

Features

- Operates From a Single 3.3V Supply
- Terminal Block Connectors for Easy RS-485/Profibus Evaluation
- 2750V_{RMS} Isolation for 60s
- Fully Assembled and Tested

Quick Start

Required Equipment

- MAX149X1 EV kit
- 3.3V, 1A DC power supply
- Signal/function generator
- Oscilloscope

[Ordering Information](#) appears at end of data sheet.

Startup Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation.

- 1) Set the DC power supply to 3.3V and connect the DC power supply between the EV kits V_{DDA} and G_{NDA} connectors.
- 2) Ensure that all jumpers are in their default positions (see [Table 1](#)).
- 3) Turn on the power supply.
- 4) Set the signal/function generator to output a 100kHz 0-to-3V square wave. *NOTE: Set the signal/function generator to operate with a high-impedance load. If needed, the R1 pad is available to add a 50Ω impedance to ground.*
- 5) Connect the signal/function generator to the TXD test point.
- 6) Using the oscilloscope, verify that the A and B outputs switch as the signal toggles.

MAX149X1 Evaluation Kit

Evaluates: MAX14938/MAX14939/
MAX14941/MAX14942/
MAX14945/MAX14948

Detailed Description of Hardware

The EV kit is a fully assembled and tested circuit board for evaluating the MAX14938 isolated RS-485/Profibus transceiver (U2). The EV kit has been designed to allow for evaluating the MAX14938 alone or in a standard RS-485 configuration. The EV kit is powered from a single 3.3V power supply.

Powering the Board

The power on the EV kit is derived from a single 3.3V source. Connect an external supply from GNDA to either the V_{DDA} test point or P1 connector to supply the 3.3V to the logic-side (A) of the circuit.

An on-board MAX258 transformer driver (U1) and external transformer (TX1) generate an isolated supply for powering the (B) isolated-side of the board. To disable the MAX258 circuit, connect jumper J1 to 2-3. To disconnect the output of the transformer circuit from the MAX14938 LDO input, remove the shunt on J5.

Evaluating the Isolated RS-485 Interface

Driver and Receiver Enable Selection

The EV kit features three jumpers (J2, J3, and J4) to enable/disable the driver and receiver outputs. Set J2 to 2-3 to enable the receiver. Set J3 to 1-2 to enable the driver. To actively control both enables, open J2 and J3 and close J4, which connects DE and \overline{RE} together.

Resistors R2–R4 Configuration

For end-of-the-line transceivers, close J6 to connect a 120Ω resistor (R3) between the A and B RS-485 I/Os on the MAX14938.

Pullup and pulldown resistors are generally used on the receiver inputs to guarantee a known state in the event that all nodes on the bus are in receive mode, or the cable becomes disconnected. The exact value for these resistors will vary with the application. Pads are provided for pullup (R2) and pulldown (R4) resistors for the A-B lines, although the use of these resistors is purely optional. Note that the MAX14938 features true fail-safe receiver inputs, which ensures that RXD is high when the receiver inputs are shorted, open, or connected to an idle bus.

Table 1. Jumper Table (J1–J6)

JUMPER	SHUNT POSITION	DESCRIPTION
J1	1-2	MAX258 transformer driver is disabled.
	2-3*	MAX258 transformer driver is enabled.
J2	1-2*	\overline{RE} is high. The RS-485 receiver is disabled.
	2-3	\overline{RE} is low. The RS-485 receiver is enabled.
J3	1-2*	DE is high. The RS-485 driver outputs are enabled.
	2-3	DE is low. The RS-485 driver outputs are disabled.
J4	Open*	DE and \overline{RE} are not connected together.
	Closed	DE and \overline{RE} are connected together.
J5	Open	Output of the transformer circuit is not connected to VLDO.
	Closed*	Output of the transformer circuit is connected to VLDO and powers the B-side of the MAX14938.

*Default position.
