

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

MAX20330

Programmable OVP Controller with VBUS Short Detection

General Description

The MAX20330 is an overvoltage controller with the VBUS impedance detection function. The device drives an external low R_{ON} path for the device that requires a flexible and adjustable OVLO threshold. The VBUS impedance detection can detect the soft short on VBUS and warn the user about the potential connector overheating.

The MAX20330 is designed to drive a single or dual back-to-back external N-channel MOSFET with a low $R_{\mbox{\scriptsize ON}}$ (10m Ω max). An external TVS can be used to protect the device from a high energy surge if necessary.

The device is available in an 8-bump (0.35mm pitch, 1.77mm x 1.03mm) wafer-level package (WLP) and operate over the -40°C to +85°C extended temperature range.

Applications

- Smart Phones
- Tablets
- Phablets
- Desktops

Benefits and Features

- Protects High-Power Portable Devices
 - Wide Operating Input Voltage Protection Range: 2.7V to 36V
 - Ultra-Fast Turn-Off Time: 100nsec
 - · Built-In Charge Pump to Drive External N-MOSFET
- Flexible Overvoltage Protection Design
 - I²C Adjustable Overvoltage Protection Trip Level
 - Wide Adjustable OVLO Threshold Range from 4V to 24V (168 steps)
 - Preset Internal Accurate OVLO Thresholds: 6.8V±2%
- Additional Protection Features Increase System Reliability
 - · VBUS Short Detection
 - · Soft-Start to Minimize In-Rush Current
 - · Internal 15ms Startup Debounce
 - · Thermal Shutdown Protection
- Space-Saving
 - 8 Bump 0.35mm Pitch 1.77mm x 1.03mm WLP

Ordering Information appears at end of data sheet.

Absolute Maximum Ratings

(All voltages referenced to GND.)	Continuous Power Dissipation (T _A = +70°C)
VBUS to GND (Note 1)0.3V to +40V	WLP (derate 10.9mW/°C above +70°C)872mW
GATE to GND0.3V to min (VBUS + 0.3V, 40V)	Operating Temperature Range40°C to +85°C
OUT to GND0.3V to min (GATE + 0.3V, 40V)	Junction Temperature+150°C
GATE to OUT0.3V to +6V	Storage Temperature Range65°C to +150°C
SDA, SCL, INT, V _{CC} to GND0.3V to +6V	Soldering Temperature (reflow)+260°C
Continuous Current into all pins±0.1A	

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Package Thermal Characteristics (Note 2)

WLP

Junction-to-Ambient Thermal Resistance (θ_{JA})91.72°C/W

Note 1: The external TVS clamp voltage should be below the abs max of MAX20330.

Note 2: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maximintegrated.com/thermal-tutorial.

Detailed Description

The MAX20330 features the overvoltage protection to the charger input VBUS line when a travel adapter (TA) is used. The MAX20330 uses the external N-MOSFET with R_{ON} lower than $10m\Omega$ and V_{DS} rating at or higher than +30V. The device protects the battery and low voltage systems against voltage faults up to $40V_{DC}.$ The external TVS could be used to further protect the device from surges. If the input voltage exceeds the overvoltage threshold, the external N-FET is disconnected from the input to prevent damage to the protected components. In addition to the OVP controller function, the MAX20330 also provides the accessory ID detection as well as VBUS short detection when the device is not in OVP mode (EN_OVP = 0).

ENb Bit

The MAX20330 is enabled by default. When disabled as VBUS is available, the part will remain enabled sinking current from VBUS.

36VDC (40V Abs Max) Withstanding

The MAX20330 can withstand the DC voltage up to 40V. If 40V input is expected, it is recommended to use the external TVS that clamps the surge to 40V or below.

OVLO

OUT is connected to VBUS when VBUS is between UVLO threshold and OVLO threshold. When VBUS goes above overvoltage lockout threshold (SET_OVLO 0x05), OUT is disconnected from VBUS, the OVLO bit is set high. When VBUS drops below SET_OVLO threshold, the OVLO bit is deasserted and the debounce time starts counting. After the debounce time, OUT follows VBUS again.

UVLO/POR

The VBUS has min operating voltage of 2.7V. The ADC works when V_{CC} voltage is 2.6V or higher. The device disables the external FET unless VBUS is higher than UVLO threshold. When the device is operating with I²C ENb bit = 0 (default), if the UVLO happens, the device shuts down the switch immediately.

Safe Turn-On Protection

When the switch turns on, if the OUT is below V_{SS_THR} of VBUS after soft start time out, it shuts down the output.

Fast Turn-Off Time

The MAX20330 provides 100ns turn off response time and can switch off an external N-MOSFET.

VBUS ID/Short Detection

The MAX20330 can check the VBUS impedance with automatic scaling for the best resolution using the different current resources. The current source can be turned on only when the OVP function is disabled (EN_OVP = 0). The ID open load voltage is 2V max. When the VBUS is soft shorted to ground, it can be detected and warn the user. Also, VBUS can be actively discharged by I²C command. This is useful when the OVP IC blocks the VBUS from discharged by the PMIC or by the USB type C controller during power down operation.

Thermal Shutdown

Thermal shutdown circuitry protects the devices from overheating. The switches turn off when the junction temperature exceeds +125°C (typ). The switches turn on again after the device temperature drops by approximately 20°C (typ).

Application Information

I²C Interface

When in I²C mode, the MAX20330 operates as a slave device that sends and receives data through an I²C-compatible 2-wire interface. The interface uses a serial data line (SDA) and a serial clock line (SCL) to achieve bidirectional communication between master(s) and slave(s). A master (typically a microcontroller) initiates all data transfers to and from the MAX20330 and generates the SCL clock that synchronizes the data transfer. The SDA line operates as both an input and an open-drain output. A pullup resistor is required on SDA. The SCL line operates only as an input. A pullup resistor is required on SCL if there are multiple masters on the 2-wire interface, or

if the master in a single-master system has an open-drain SCL output. Each transmission consists of a START condition sent by a master, followed by the MAX20330 7-bit slave address plus R/W bit, a register address byte, one or more data bytes, and finally a STOP condition (Figure 3).

Start and Stop Conditions

Both SCL and SDA remain high when the interface is not busy. A master signals the beginning of a transmission with a START (S) condition by transitioning SDA from high-to-low while SCL is high (Figure 4). When the master has finished communicating with the slave, it issues a STOP (P) condition by transitioning SDA from low to high while SCL is high. The bus is then free for another transmission.

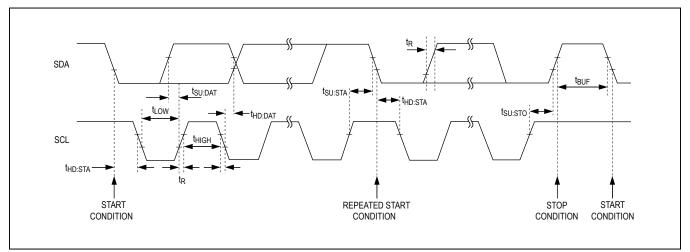

Figure 3. I²C Interface Timing Details

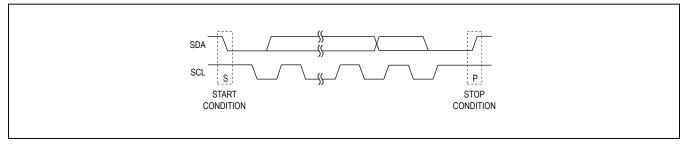

Figure 4. Start and Stop Conditions

Bit Transfer

One data bit is transferred during each clock pulse (Figure 5). The data on SDA must remain stable while SCL is high. Changes in SDA while SCK is high and stable are considered control signals (see *Start and Stop Conditions*)

Acknowledge

The acknowledge bit is a clocked 9th bit (Figure 6), which the recipient uses to handshake receipt of each byte of data. Thus, each byte transferred effectively requires 9 bits. The master generates the 9th clock pulse, and the recipient pulls down SDA during the acknowledge clock pulse. The SDA line is stable low during the high period of the clock pulse. When the master is transmitting to the MAX20330, it generates the acknowledge bit because the

device is the recipient. When the device is transmitting to the master, the master generates the acknowledge bit because the master is the recipient. If the device did not pull SDA low, a not acknowledge is indicated.

Slave Address

The MAX20330 features a 7-bit slave address: 0010 111. The bit following a 7-bit slave address is the R/\overline{W} bit, which is low for a write command and high for a read command.

Bus Reset

The MAX20330 resets the bus with the I²C start condition for reads. When the R/\overline{W} bit is set to 1, the device transmits data to the master, thus the master is reading from the device.

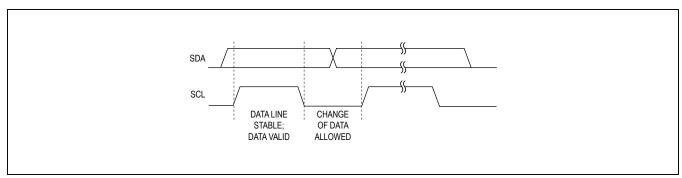

Figure 5. Bit Transfer

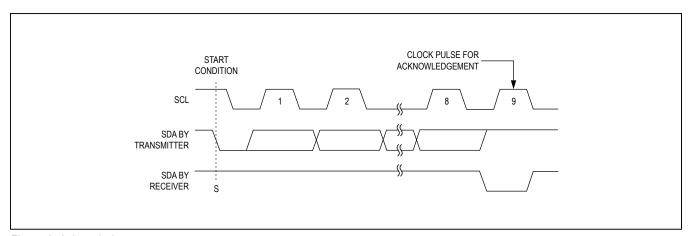

Figure 6. Acknowledge

Format for Writing

A write to the MAX20330 comprises the transmission of the slave address with the R/\overline{W} bit set to zero, followed by at least 1 byte of information. The first byte of information is the register address or command byte. The register address determines which register of the device is to be written by the next byte, if received. If a STOP (P) condition is detected after the register address is received,

then the device takes no further action beyond storing the register address. Any bytes received after the register address are data bytes. The first data byte goes into the register selected by the register address and subsequent data bytes go into subsequent registers (Figure 7). If multiple data bytes are transmitted before a STOP condition, these bytes are stored in subsequent registers because the register addresses autoincrement (Figure 8).

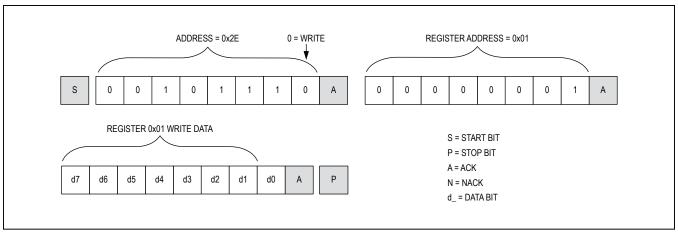

Figure 7. Format for I²C Write

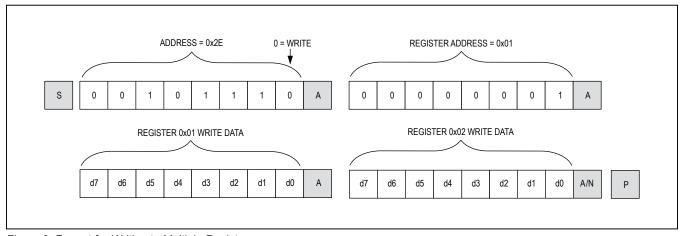

Figure 8. Format for Writing to Multiple Registers

Format for Reading

The MAX20330 is read using the internally stored register address as an address pointer, the same way the stored register address is used as an address pointer for a write. The pointer autoincrements after each data byte is read using the same rules as for a write. Thus, a read is initiated

by first configuring the register address by performing a write (Figure 9). The master can now read consecutive bytes from the device, with the first data byte being read from the register addressed pointed by the previously written register address (Figure 10). Once the master sounds a NACK, the MAX20330 stops sending valid data.

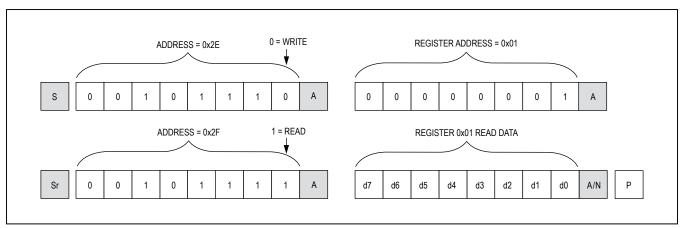

Figure 9. Format for Reads (Repeated Start)

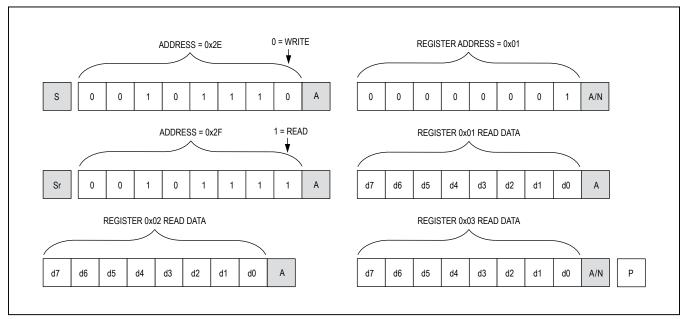

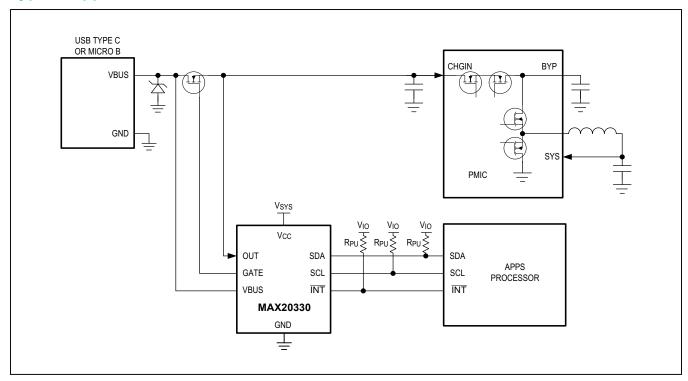

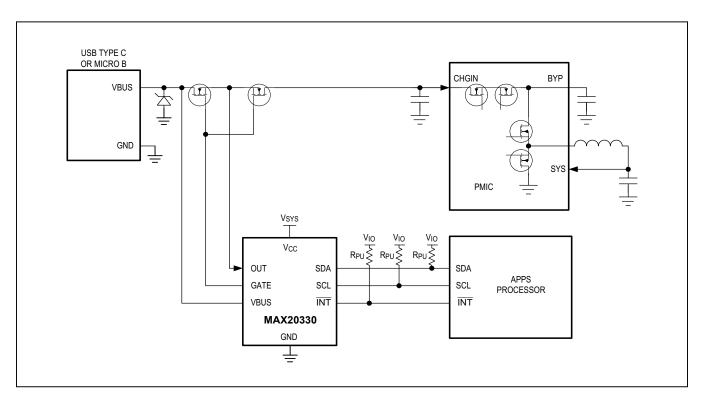

Figure 10. Format for Reading Multiple Registers

Typical Application Circuits

Ordering Information

PART	TOP	TEMP	PIN-
	MARK	RANGE	PACKAGE
MAX20330EWA+T	CA	-40°C TO +85°C	8 WLP

⁺ Denotes lead(Pb)-free/RoHS-compliant package.

Chip Information

PROCESS: BICMOS

Package Information

For the latest package outline information and land patterns (footprints), go to www.maximintegrated.com/packages. Note that a "+", "#", or "-" in the package code indicates RoHS status only. Package drawings may show a different suffix character, but the drawing pertains to the package regardless of RoHS status.

PACKAGE	PACKAGE	OUTLINE	LAND
TYPE	CODE	NO.	PATTERN NO.
8 WLP	W81B1+1	21-100229	Refer to Application Note 1891

T = Tape and reel.

MAX20330

Programmable OVP Controller with **VBUS Short Detection**

Revision History

REVISION NUMBER	REVISION DATE	DESCRIPTION	PAGES CHANGED
0	3/18	Initial release	_
1	6/18	Updated Table 2	14

For pricing, delivery, and ordering information, please contact Maxim Direct at 1-888-629-4642, or visit Maxim Integrated's website at www.maximintegrated.com.

Maxim Integrated cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim Integrated product. No circuit patent licenses are implied. Maxim Integrated reserves the right to change the circuitry and specifications without notice at any time. The parametric values (min and max limits) shown in the Electrical Characteristics table are guaranteed. Other parametric values quoted in this data sheet are provided for guidance.
