

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

3.6V, 1W RF Power Transistors for 900MHz Applications

MAX2601/MAX2602

General Description

The MAX2601/MAX2602 are RF power transistors optimized for use in portable cellular and wireless equipment that operates from three NiCd/NiMH cells or one Li-Ion cell. These transistors deliver 1W of RF power from a 3.6V supply with efficiency of 58% when biased for constant-envelope applications (e.g., FM or FSK). For NADC (IS-54) operation, they deliver 29dBm with -28dBc ACPR from a 4.8V supply.

The MAX2601 is a high-performance silicon bipolar RF power transistor. The MAX2602 includes a high-performance silicon bipolar RF power transistor, and a biasing diode that matches the thermal and process characteristics of the power transistor. This diode is used to create a bias network that accurately controls the power transistor's collector current as the temperature changes.

The MAX2601/MAX2602 can be used as the final stage in a discrete or module power amplifier. Silicon bipolar technology eliminates the need for voltage inverters and sequencing circuitry, as required by GaAsFET power amplifiers. Furthermore, a drain switch is not required to turn off the MAX2601/MAX2602. This increases operating time in two ways: it allows lower system end-of-life battery voltage, and it eliminates the wasted power from a drain-switch device.

The MAX2601/MAX2602 are available in thermally enhanced, 8-pin SO packages, which are screened to the extended temperature range (-40°C to +85°C).

Applications

Narrow-Band PCS (NPCS)
915MHz ISM Transmitters
Microcellular GSM (Power Class 5)
AMPS Cellular Phones
Digital Cellular Phones
Two-Way Paging
CDPD Modems
Land Mobile Radios

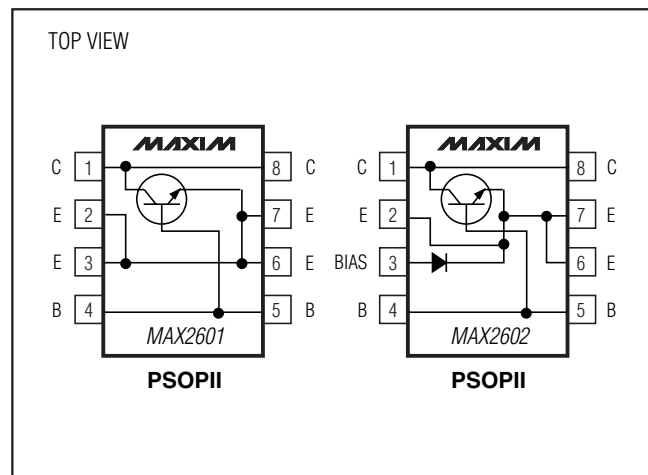

Features

- ◆ **Low Voltage:** Operates from 1 Li-Ion or 3 NiCd/NiMH Batteries
- ◆ **DC-to-Microwave Operating Range**
- ◆ **1W Output Power at 900MHz**
- ◆ **On-Chip Diode for Accurate Biasing (MAX2602)**
- ◆ **Low-Cost Silicon Bipolar Technology**
- ◆ **Does Not Require Negative Bias or Supply Switch**
- ◆ **High Efficiency: 58%**

3.6V, 1W RF Power Transistors for 900MHz Applications

ABSOLUTE MAXIMUM RATINGS

Collector-Emitter Voltage, Shorted Base (V_{CES})17V
 Emitter Base Reverse Voltage (V_{EBO}).....2.3V
 BIAS Diode Reverse Breakdown Voltage (MAX2602)2.3V
 Average Collector Current (I_C).....1200mA
 Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)
 SOIC (derate 80mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$) (Note 1)6.4W

Operating Temperature Range -40°C to $+85^\circ\text{C}$
 Storage Temperature Range -65°C to $+165^\circ\text{C}$
 Junction Temperature $+150^\circ\text{C}$
 Lead Temperature (soldering, 10s) $+300^\circ\text{C}$

Note 1: Backside slug must be properly soldered to ground plane (see *Slug Layout Techniques* section).

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

($T_A = T_{MIN}$ to T_{MAX} , unless otherwise noted.)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Collector-Emitter Breakdown Voltage	BV_{CEO}	$I_C < 100\mu\text{A}$	15			V
	BV_{CES}					
Collector-Emitter Sustaining Voltage	LV_{CEO}	$I_C = 200\text{mA}$	5.0			V
Collector-Base Breakdown Voltage	BV_{CBO}	$I_C < 100\mu\text{A}$, emitter open	15			V
DC Current Gain	h_{FE}	$I_C = 250\text{mA}$, $V_{CE} = 3\text{V}$	100			
Collector Cutoff Current	I_{CES}	$V_{CE} = 6\text{V}$, $V_{BE} = 0\text{V}$		0.05	1.5	μA
Output Capacitance	C_{OB}	$V_{CB} = 3\text{V}$, $I_E = 0\text{mA}$, $f = 1\text{MHz}$		9.6		pF

AC ELECTRICAL CHARACTERISTICS

(Test Circuit of Figure 1, $V_{CC} = 3.6\text{V}$, $V_{BB} = 0.750\text{V}$, $Z_{LOAD} = Z_{SOURCE} = 50\Omega$, $P_{OUT} = 30\text{dBm}$, $f = 836\text{MHz}$, $T_A = +25^\circ\text{C}$, unless otherwise noted.)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
Frequency Range	f	(Note 2)	DC		1	GHz
Base Current	I_B			4.2		mA
Harmonics	2fo, 3fo	$V_{CC} = 3.6\text{V}$, $P_{OUT} = 30\text{dBm}$		-43		dBc
		$V_{CC} = 3.0\text{V}$, $P_{OUT} = 29\text{dBm}$		-42		
Power Gain		$P_{OUT} = 30\text{dBm}$		11.6		dB
Collector Efficiency	η	No modulation		58		%
Stability under Continuous Load Mismatch Conditions	V_{SWR}	$V_{CC} = 5.5\text{V}$, all angles (Note 3)		8:1		
Two-Tone IMR	IM3	$P_{OUT} = +30\text{dBm}$ total power, $f_1 = 835\text{MHz}$, $f_2 = 836\text{MHz}$		-16		dBc
	IM5			-25		
Noise Figure	NF	$V_{BB} = 0.9\text{V}$		3.3		dB

Note 2: Guaranteed by design.

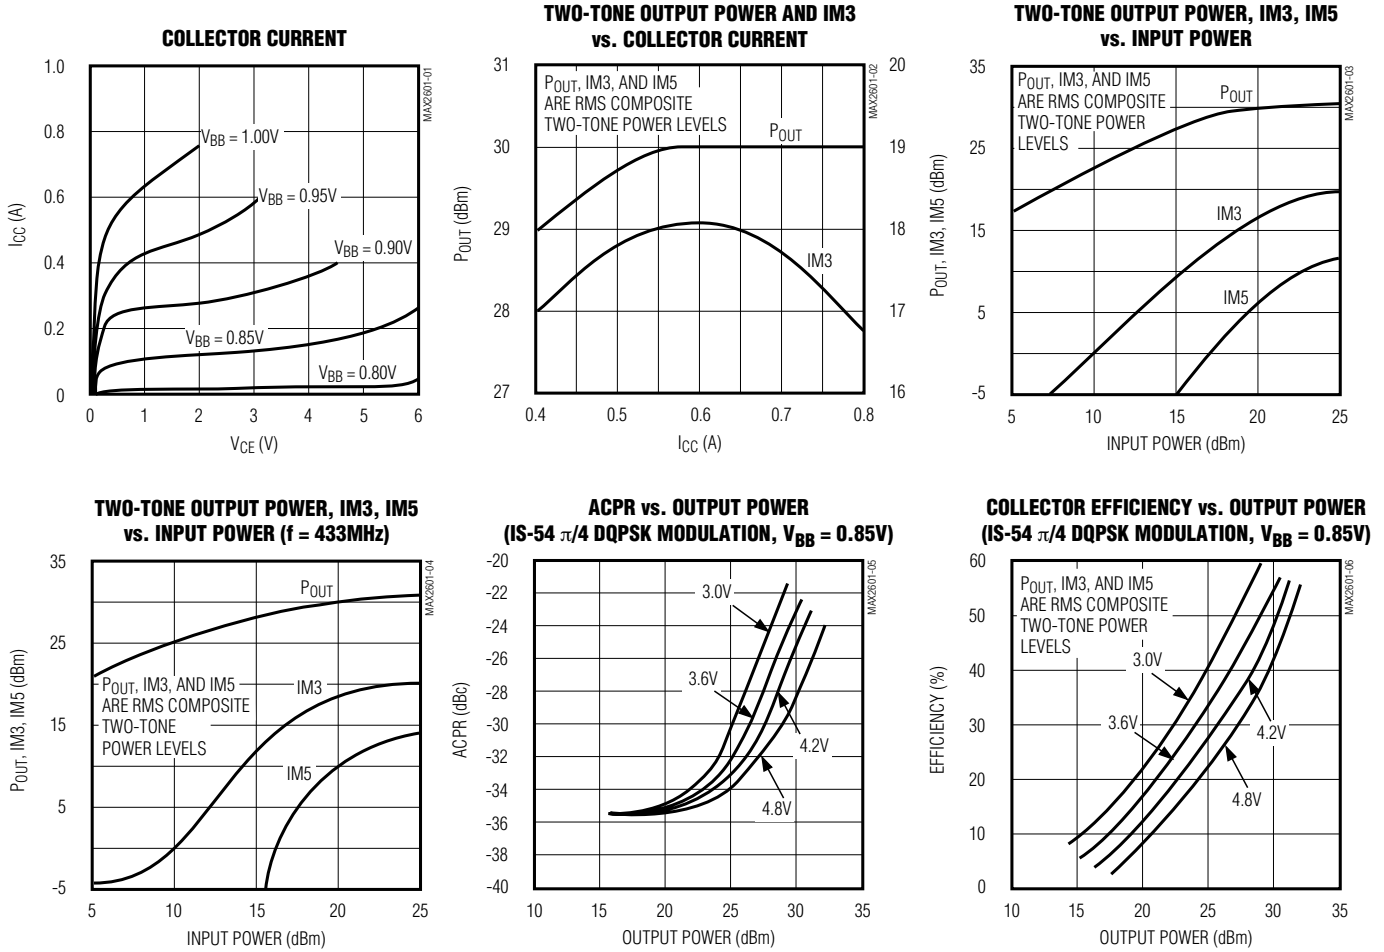

Note 3: Under these conditions: a) no spurious oscillations shall be observed at collector greater than -60dBc ; b) no parametric degradation is observable when mismatch is removed; and c) no current draw in excess of the package dissipation capability is observed.

Detailed Description

MAX2601/MAX2602

The MAX2601/MAX2602 are high-performance silicon bipolar transistors in power-enhanced, 8-pin SO packages. The base and collector connections use two pins each to reduce series inductance. The emitter connects to three (MAX2602) or four (MAX2601) pins in addition to a back-side heat slug, which solders directly to the PC board ground to reduce emitter inductance and improve thermal dissipation. The transistors are intended to be used in the common-emitter configuration for maximum power gain and power-added efficiency.

Current Mirror Bias (MAX2602 only)

The MAX2602 includes a high-performance silicon bipolar RF power transistor and a thermally matched biasing diode that matches the power transistor's thermal and process characteristics. This diode is used to create a bias network that accurately controls the power transistor's collector current as the temperature changes (Figure 2).

The biasing diode is a scaled version of the power transistor's base-emitter junction, in such a way that the current through the biasing diode is 1/15 the quiescent collector current of the RF power transistor. Supplying the biasing diode with a constant current source and connecting the diode's anode to the RF power transistor's base ensures that the RF power transistor's quiescent collector current remains constant through

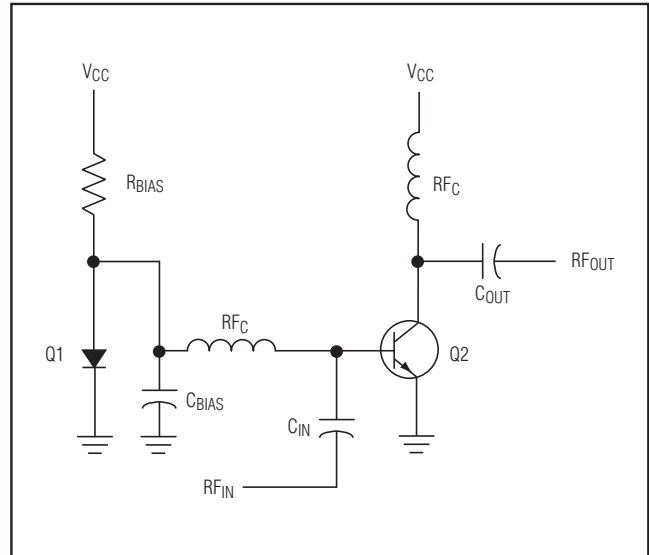

Figure 2. Bias Diode Application

temperature variations. Simply tying the biasing diode to the supply through a resistor is adequate in most situations. If large supply variations are anticipated, connect the biasing diode to a reference voltage through a resistor, or use a stable current source. Connect the biasing diode to the base of the RF power transistor through a large RF impedance, such as an RF choke (inductor), and decouple to ground through a surface-mount chip capacitor larger than 1000pF.

3.6V, 1W RF Power Transistors for 900MHz Applications

Applications Information

Optimum Port Impedance

The source and load impedances presented to the MAX2601/MAX2602 have a direct impact upon its gain, output power, and linearity. Proper source- and load-terminating impedances (Z_S and Z_L) presented to the power transistor base and collector will ensure optimum performance.

For a power transistor, simply applying the conjugate of the transistor's input and output impedances calculated from small-signal S-parameters will yield less than optimum device performance.

For maximum efficiency at $V_{BB} = 0.75V$ and $V_{CC} = 3.6V$, the optimum power-transistor source and load impedances (as defined in Figure 3) are:

At 836MHz: $Z_S = 5.5 + j2.0$
 $Z_L = 6.5 + j1.5$

At 433MHz: $Z_S = 9.5 - j2.5$
 $Z_L = 8.5 - j1.5$

Z_S and Z_L reflect the impedances that should be presented to the transistor's base and collector. The package parasitics are dominated by inductance (as shown in Figure 3), and need to be accounted for when calculating Z_S and Z_L .

The internal bond and package inductances shown in Figure 3 should be included as part of the end-application matching network, depending upon exact layout topology.

Slug Layout Techniques

The most important connection to make to the MAX2601/MAX2602 is the back side. It should connect directly to the PC board ground plane if it is on the top side, or through numerous plated through-holes if the ground plane is buried. For maximum gain, this connection should have very little self-inductance. Since it is also the thermal path for heat dissipation, it must have low thermal impedance, and the ground plane should be large.
