

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

MAX2654/MAX2655/MAX2656 Evaluation Kits

General Description

The MAX2654/MAX2655/MAX2656 evaluation kits (EV kits) simplify evaluation of the MAX2654/MAX2655/MAX2656 low-noise amplifiers (LNAs). These kits enable testing of the devices' performance and require no additional support circuitry. The signal input and output use SMA connectors to facilitate connection of RF test equipment.

The MAX2654/MAX2655/MAX2656 EV kits are fully assembled with the MAX2654/MAX2655/MAX2656 on board, and incorporate input matching components optimized for specific frequency operation.

Features

- ◆ Easy Evaluation of MAX2654/MAX2655/MAX2656
- ◆ +2.7V to +5.5V Single-Supply Operation
- ◆ RF Input and Output Matched to 50Ω
- ◆ Jumper Included for Gain/Shutdown Setting
- ◆ Fully Assembled and Tested

Ordering Information

PART	TEMP. RANGE	IC PACKAGE
MAX2654EVKIT	-40°C to +85°C	6 SC70-6
MAX2655EVKIT	-40°C to +85°C	6 SC70-6
MAX2656EVKIT	-40°C to +85°C	6 SC70-6

MAX2654/MAX2655/MAX2656 Evaluation Kits

Evaluate: MAX2654/MAX2655/MAX2656

Quick Start

The MAX2654/MAX2655/MAX2656 EV kits are fully assembled and factory tested. Follow the instructions in the *Connections and Setup* section for proper device evaluation.

Test Equipment Required

- An RF signal generator capable of delivering -30dBm of output power and a frequency range covering the MAX2654/MAX2655/MAX2656 (1400MHz to 2000MHz, for example)
- An RF spectrum analyzer that covers the operating frequency range
- A DC power supply capable of supplying +2.7V to +5.5V
- Two 50Ω coaxial cables with SMA connectors
- An ammeter to measure supply current (optional)
- A noise figure meter (optional)
- A network analyzer for measuring gain and return loss (optional)

Connections and Setup

Checking Power Gain

- 1) Connect a DC supply (preset to +3.0V) to the V_{CC} and GND terminals (through an ammeter, if desired) on the EV kit.
- 2) Set the RF generator for a desired frequency at a power level of -30dBm. Connect the RF generator's output to the RFIN SMA connector.
- 3) Connect the coaxial cable from the RFOUT SMA connector to the spectrum analyzer.
- 4) Turn on the DC supply. The supply current should read approximately 6mA for MAX2654, 8mA for MAX2655, and 11mA for MAX2656.
- 5) Activate the RF generator's output. A signal on the spectrum analyzer's display should indicate a typical gain as shown on the device data sheet after accounting for cable and board losses.
- 6) Optional: For the MAX2656, set the jumper JU2 to the V_{CC} position. The power gain should now be about 1dB.

- 7) Optional: Another method of determining gain is by using a network analyzer. This has the advantage of displaying gain vs. a swept frequency band, in addition to displaying input and output return loss. Refer to the user manual of the network analyzer for setup details.

Checking Noise Figure

Noise figure measurements on low-noise devices are extremely sensitive to board and lab setup losses and parasitics. There are many techniques and precautions for measuring low noise figure. A detailed explanation of these items would exceed the scope of this document. Take into account PC board and external components loss when performing noise-figure measurements. The typical input losses on these EV kits is 0.2dB at 1575MHz and 0.25dB at 1960MHz. For more information on how to perform this level of noise-figure measurement, refer to the noise-figure meter operating manual and to Hewlett Packard's application note #57-2, Noise Figure Measurement Accuracy.

Layout Considerations

Good PC board layout is an essential part of an RF circuit's design. The EV kit PC board can serve as a guide for laying out a board using the MAX2654/MAX2655/MAX2656. Generally, the V_{CC} node on the PC board should have a decoupling capacitor located close to the device, and additional capacitors may be needed for long V_{CC} lines. This minimizes supply coupling. Proper grounding of the GND pins is essential. Connect the GND pins to the ground plane either directly, through vias, or both. For MAX2654, connect pin 1 to the PC board ground plane through a 0.017in width by 0.035in length line.
