

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

MAX2686/MAX2688

GPS/GNSS Low-Noise Amplifiers

General Description

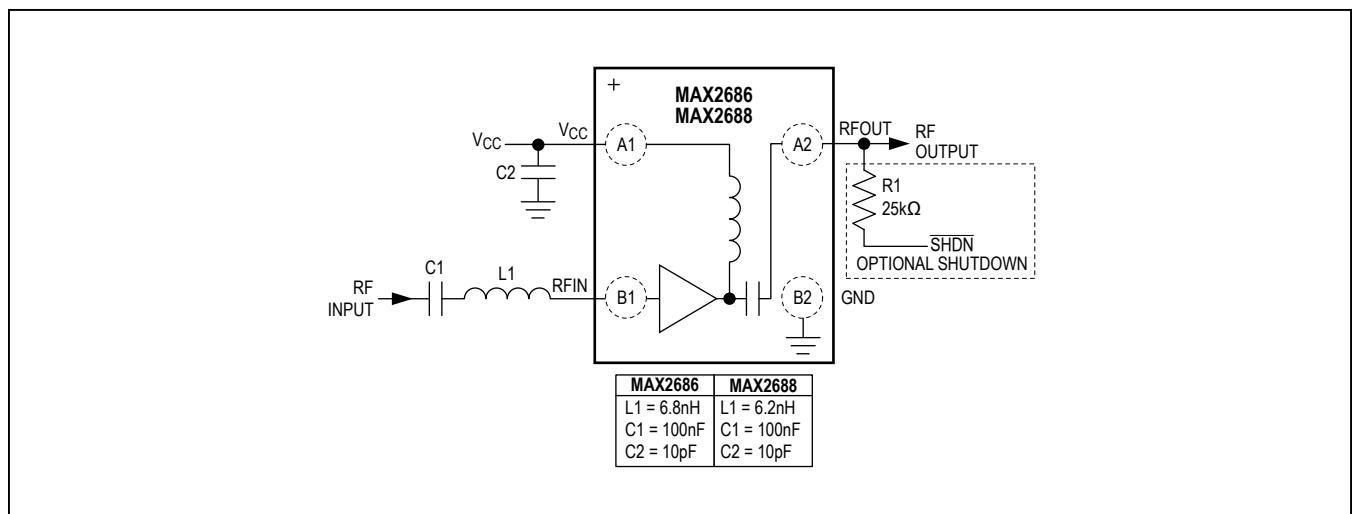

The MAX2686/MAX2688 low-noise amplifiers (LNAs) are designed for GPS L1, Galileo, and GLONASS applications. Designed in Maxim's advanced SiGe process, the devices achieve high gain and ultra-low-noise figure while maximizing the input-referred 1dB compression point and the 3rd-order intercept point. The MAX2686 provides a high gain of 19dB. The MAX2688 supplies 15dB of gain while attaining higher linearity.

The devices operate from a +1.6V to +3.3V single supply. The optional shutdown feature in the devices reduces the supply current to less than 10 μ A. The devices are available in a very small, lead-free, RoHS-compliant, 0.86mm x 0.86mm x 0.65mm wafer-level package (WLP).

Applications

- Automotive Navigation
- Telematics (Asset Tracking and Management)
- Personal Navigation Devices (PNDs)
- Cellular Phones with GPS
- Notebook PCs/Ultra-Mobile PCs
- Recreational, Marine Navigation
- Avionics
- Watches
- Digital Cameras

Typical Application Circuit

Features

- High-Power Gain: 19dB (MAX2686)
- Ultra-Low-Noise Figure: 0.75dB (MAX2686)
- Integrated 50 Ω Output Matching Circuit
- Low Supply Current: 4.1mA
- Wide Supply Voltage Range: 1.6V to 3.3V
- Low Bill of Materials: One Inductor, Two Capacitors
- Small Footprint: 0.86mm x 0.86mm
- Thin Profile: 0.65mm
- 0.4mm-Pitch Wafer-Level Package (WLP)

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Bump Configuration

Bump Description

BUMP	NAME	FUNCTION
A1	V _{CC}	Supply Voltage. Bypass to ground with a 10pF capacitor as close as possible to the IC.
A2	RFOUT (SHDN)	RF Output/ $\overline{\text{SHDN}}$ Input. RFOUT is internally matched to 50Ω and pulled up to V _{CC} through a 1MΩ resistor. $\overline{\text{SHDN}}$ is shared with the RFOUT bump. The devices are in active mode by default once V _{CC} is applied. RFOUT(SHDN) can be pulled to a DC low externally to shut down the IC.
B1	RFIN	RF Input. Requires a DC-blocking capacitor and external matching components.
B2	GND	Ground. Connect to the PCB ground plane.

Detailed Description

The MAX2686/MAX2688 are LNAs designed for GPS L1, Galileo, and GLONASS applications. The devices feature an optional power-shutdown control mode to eliminate the need for an external supply switch. The devices achieve high gain, ultra-low-noise figure, and excellent linearity.

Input and Output Matching

The devices require an off-chip input matching. Only an inductor in series with a DC-blocking capacitor is needed to form the input matching circuit. The *Typical Application Circuit* shows the recommended input-matching network. These values are optimized for the best simultaneous gain, noise figure, and return loss performance. The value of the input coupling capacitor affects IIP3. A smaller coupling

capacitor results in lower IIP3. The devices integrate an on-chip output matching to 50Ω at the output, eliminating the need for external matching components. Tables 1 and 2 list typical device S parameters and K_f values. Typical noise parameters are shown in Tables 3 and 4.

Shutdown

The devices include an optional shutdown feature to turn off the entire chip. The devices are placed in active mode by default once V_{CC} is applied, due to the on-chip pull-up resistor to V_{CC} at the RFOUT bump (shared with the $\overline{\text{SHDN}}$ input). To shut down the part, apply a logic-low to the RFOUT bump through an external resistor with an adequate value, e.g., 25kΩ, in order not to load the RF output signal during active operation.

Applications Information

A properly designed PCB is essential to any RF micro-wave circuit. Use controlled-impedance lines on all high-frequency inputs and outputs. Bypass V_{CC} with decoupling capacitors located close to the device. For long V_{CC} lines, it may be necessary to add decoupling capacitors. Locate these additional capacitors further away from the device package. Proper grounding of the GND pin is essential. If the PCB uses a topside RF ground, connect it directly to the GND pin. For a board where the ground is not on the component layer, connect the GND pin to the board with multiple vias close to the package.
