

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Dual Bidirectional Low-Level Translator in μ DFN

MAX3397E

General Description

The MAX3397E ± 15 kV ESD-protected bidirectional level translator provides level shifting for data transfer in a multivoltage system. Externally applied voltages, V_{CC} and V_L , set the logic levels on either side of the device. A logic-low signal present on the V_L side of the device appears as a logic-low signal on the V_{CC} side of the device, and vice versa. The MAX3397E utilizes a transmission-gate-based design to allow data translation in either direction ($V_L \leftrightarrow V_{CC}$) on any single data line. The MAX3397E accepts V_L from +1.2V to +5.5V and V_{CC} from +1.65V to +5.5V, making the device ideal for data transfer between low-voltage ASICs/PLDs and higher voltage systems.

The MAX3397E features a shutdown mode that reduces supply current to less than $1\mu\text{A}$, thermal short-circuit protection, and ± 15 kV ESD protection on the V_{CC} side for greater protection in applications that route signals externally. The MAX3397E operates at a guaranteed data rate of 8Mbps over the entire specified operating voltage range. Within specific voltage domains, higher data rates are possible. See the *Timing Characteristics* table.

The MAX3397E is available in an 8-pin μ DFN package and specified over the extended -40°C to $+85^\circ\text{C}$ operating temperature range.

Applications

Cell Phones, MP3 Players
Telecommunications Equipment
SPI™, MICROWIRE™, and I²C Level Translation
Portable POS Systems, Smart Card Readers
Low-Cost Serial Interfaces, GPS

SPI is a trademark of Motorola, Inc.
MICROWIRE is a trademark of National Semiconductor Corp.

Typical Application Circuit appears at end of data sheet.

Features

- ◆ Bidirectional Level Translation
- ◆ Guaranteed Data Rate
 - 8Mbps ($+1.2\text{V} \leq V_L \leq V_{CC} \leq +5.5\text{V}$)
 - 16Mbps ($+1.8\text{V} \leq V_L \leq V_{CC} \leq +3.3\text{V}$)
- ◆ Extended ESD Protection on the I/O V_{CC} Lines
 - ± 15 kV Human Body Model
 - ± 15 kV Air-Gap Discharge per IEC 61000-4-2
 - ± 8 kV Contact Discharge per IEC 61000-4-2
- ◆ Enable/Shutdown
- ◆ Ultra-Low $1\mu\text{A}$ Supply Current in Shutdown Mode
- ◆ 8-Pin μ DFN Package

Pin Description

PIN	NAME	FUNCTION
1	I/O V_{CC2}	Input/Output 2. Referenced to V_{CC} .
2	GND	Ground
3	V_L	Logic-Input Voltage. The supply voltage range is $+1.2V \leq V_L \leq +5.5V$. Bypass this supply with a $0.1\mu F$ capacitor located as close as possible to the input.
4	I/O V_{L2}	Input/Output 2. Referenced to V_L .
5	I/O V_{L1}	Input/Output 1. Referenced to V_L .
6	EN	Enable Input. Drive EN high to enable the device. Drive EN low to put the device in shutdown mode.
7	V_{CC}	V_{CC} Input Voltage. The supply voltage range is $+1.65V \leq V_{CC} \leq +5.5V$. Bypass this supply with a $0.1\mu F$ capacitor located as close as possible to the input. A $1\mu F$ ceramic capacitor is recommended for full ESD protection.
8	I/O V_{CC1}	Input/Output 1. Referenced to V_{CC} .

Detailed Description

The MAX3397E bidirectional, ESD-protected level translator provides the level shifting necessary to allow data transfer in a multivoltage system. Externally applied voltages, V_{CC} and V_L , set the logic levels on either side of the device. A logic-low signal present on the V_L side of the device appears as a logic-low signal on the V_{CC} side of the device, and vice versa. The device uses a transmission-gate-based design (see the *Functional Diagram*) to allow data translation in either direction ($V_L \leftrightarrow V_{CC}$) on any single data line. The MAX3397E accepts V_L from $+1.2V$ to $+5.5V$ and V_{CC}

from $+1.65V$ to $+5.5V$, making the device ideal for data transfer between low-voltage ASICs/PLDs and higher voltage systems.

The MAX3397E features a shutdown mode that reduces the supply current to less than $1\mu A$, thermal short-circuit protection, and $\pm 15kV$ ESD protection on the V_{CC} side for greater protection in applications that route signals externally. The device operates at a guaranteed data rate of 8Mbps over the entire specified operating voltage range. Within specific voltage domains, higher data rates are possible. See the *Timing Characteristics* table.

Dual Bidirectional Low-Level Translator in μ DFN

MAX3397E

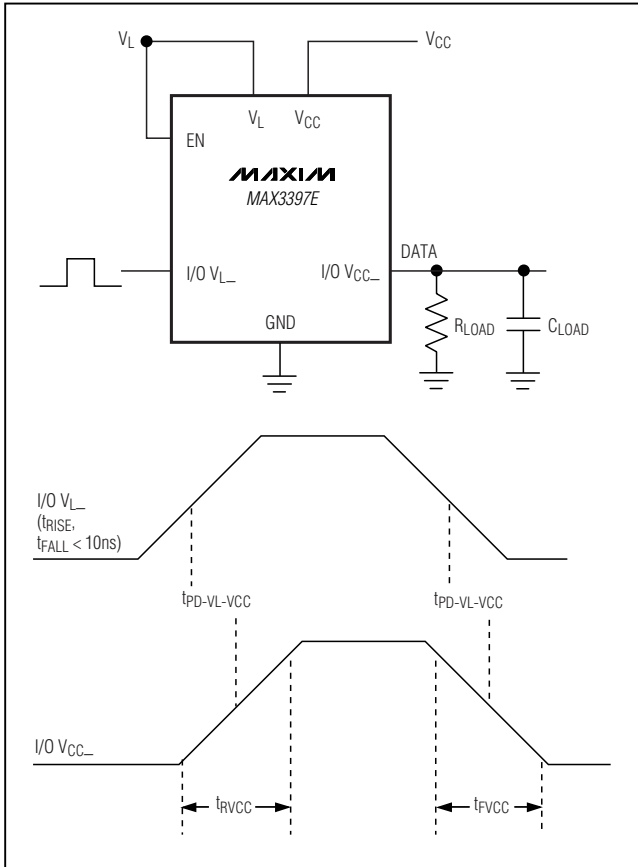

Figure 1a. Rail-to-Rail Driving I/O V_L

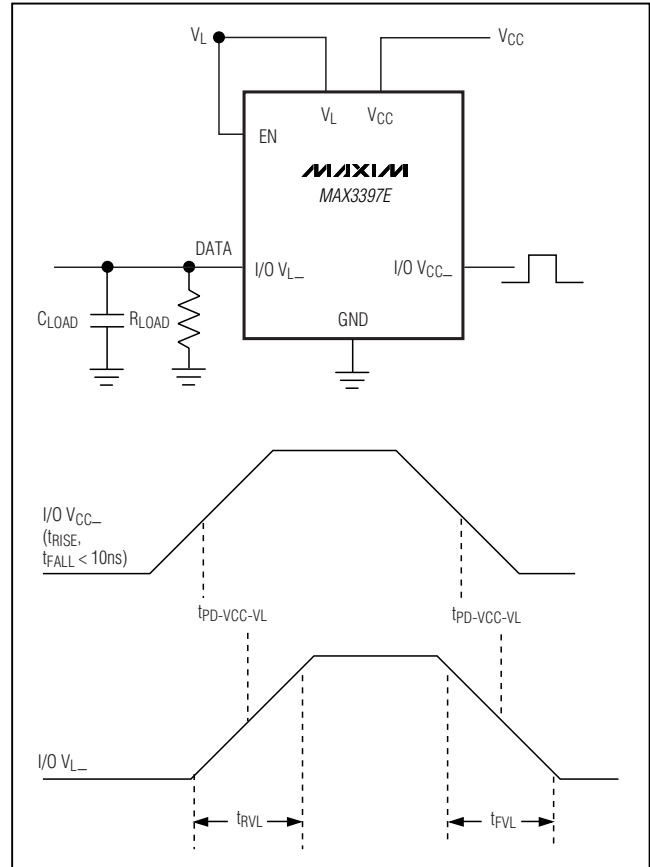

Figure 1b. Rail-to-Rail Driving I/O V_{CC}

Level Translation

For proper operation, ensure that $+1.65V \leq V_{CC} \leq +5.5V$ and $+1.2V \leq V_L \leq +5.5V$. During power-up sequencing, $V_L \geq (V_{CC} + 0.3V)$ does not damage the device. The speed-up circuitry limits the maximum data rate for the MAX3397E to 16Mbps. The maximum data rate also depends heavily on the load capacitance (see the *Typical Operating Characteristics*), output impedance of the driver, and the operational voltage range (see the *Timing Characteristics* table).

Rise-Time Accelerators

The MAX3397E has an internal rise-time accelerator, allowing operation up to 16Mbps. The rise-time accelerators are present on both sides of the device and act to speed up the rise time of the input and output of the device, regardless of the direction of the data. The triggering mechanism for these accelerators is both level and edge sensitive. To prevent false triggering of the rise-time accelerators, signal fall times of less than

20ns/V are recommended for both the inputs and outputs of the device. Under less noisy conditions, longer signal fall times are acceptable. **Note:** To guarantee operation of the rise time accelerators the maximum parasitic capacitance should be less than 200pF on the I/O lines.

Shutdown Mode

Drive EN low to place the MAX3397E in shutdown mode. Connect EN to V_L or V_{CC} (logic-high) for normal operation. Activating the shutdown mode disconnects the internal $10k\Omega$ pullup resistors on the I/O V_{CC} and I/O V_L lines. This forces the I/O lines to a high-impedance state, and decreases the supply current to less than $1\mu A$. The high-impedance I/O lines in shutdown mode allow for use in a multidrop network. The MAX3397E effectively has a diode from each I/O to the corresponding supply rail and GND. Therefore, when in shutdown mode, do not allow the voltage at I/O V_L to exceed $(V_L + 0.3V)$, or the voltage at I/O V_{CC} to exceed $(V_{CC} + 0.3V)$.

Dual Bidirectional Low-Level Translator in μ DFN

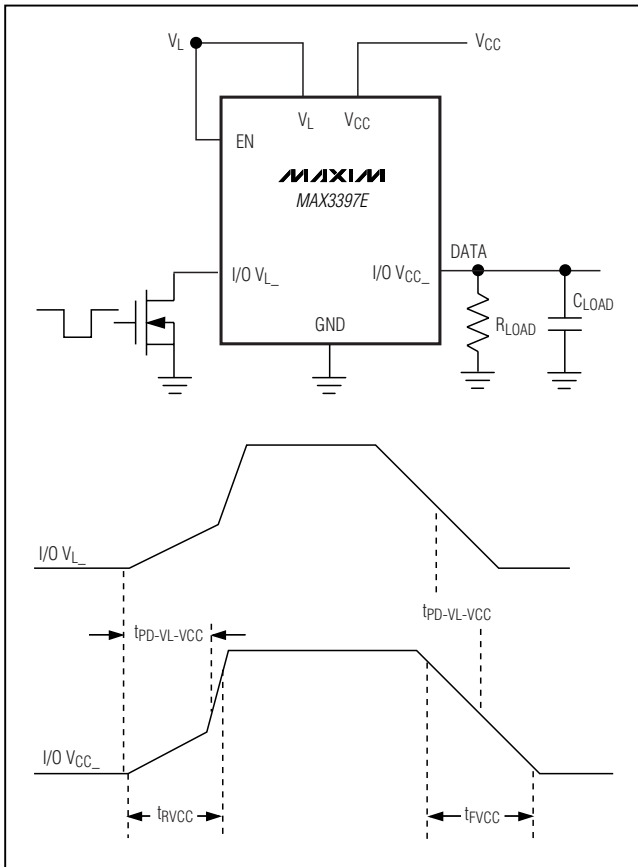

Figure 1c. Open-Drain Driving I/O V_L

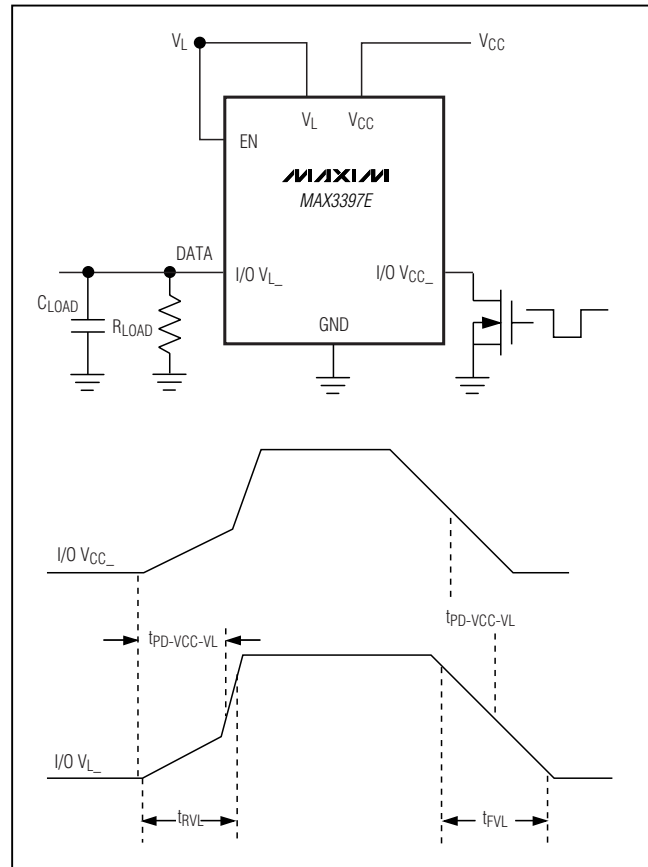

Figure 1d. Open-Drain Driving I/O V_{CC}

Operation with One Supply Disconnected

Certain applications require sections of circuitry to be disconnected to save power. When V_L is connected and V_{CC} is disconnected or connected to ground, the device enters shutdown mode. In this mode, I/O V_L can still be driven without damage to the device; however, data does not translate from I/O V_L to I/O V_{CC} . If V_{CC} falls more than 0.8V (typ) below V_L , the device disconnects the pullup resistors at I/O V_L and I/O V_{CC} . To achieve the lowest possible supply current from V_L when V_{CC} is disconnected, it is recommended that the voltage at the V_{CC} supply input be approximately equal to GND. **Note:** When V_{CC} is disconnected or connected to ground, I/O V_{CC} must not be driven more than $V_{CC} + 0.3V$.

When V_{CC} is connected and V_L is less than 0.7V (typ), the device enters shutdown mode. In this mode, I/O V_{CC} can still be driven without damage to the device; however, data does not translate from I/O V_{CC} to I/O V_L . **Note:** When V_L is disconnected or connected to ground, I/O V_L must not be driven more than $V_L + 0.3V$.

Thermal Short-Circuit Protection

Thermal-overload detection protects the MAX3397E from short-circuit fault conditions. In the event of a short-circuit fault, when the junction temperature (T_J) reaches $+150^\circ\text{C}$, a thermal sensor signals the shutdown mode logic to force the device into shutdown mode. When the T_J has cooled to $+140^\circ\text{C}$, normal operation resumes.

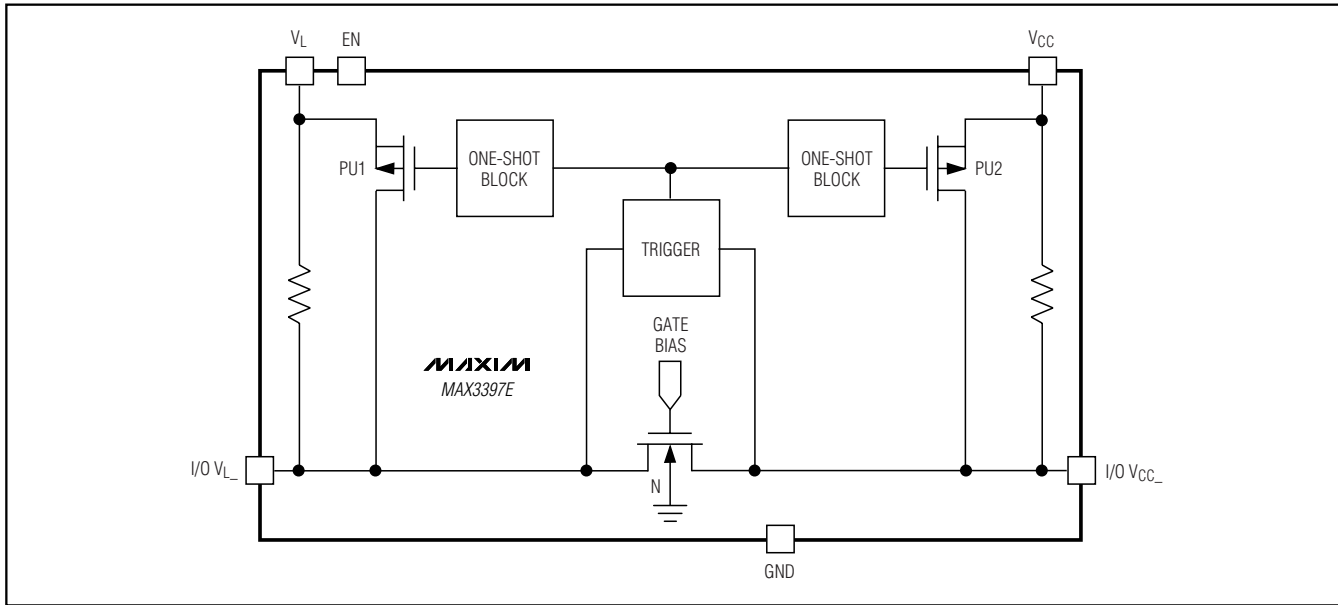

$\pm 15\text{kV}$ ESD Protection

As with all Maxim devices, ESD-protection structures are incorporated on all pins to protect against electrostatic discharges encountered during handling and assembly. The I/O V_{CC} lines have extra protection against static electricity. Maxim's engineers have developed state-of-the-art structures to protect these pins against ESD of $\pm 15\text{kV}$ without damage. The ESD structures withstand high ESD in all states: normal operation, shutdown mode, and powered down. After an ESD event, Maxim's E versions keep working without

Dual Bidirectional Low-Level Translator in μ DFN

MAX3397E

Functional Diagram

latchup, whereas competing products can latch and must be powered down to remove latchup. ESD protection can be tested in various ways. The I/O V_{CC} lines of the MAX3397E are characterized for protection to the following limits:

- 1) $\pm 15\text{kV}$ using the Human Body Model
- 2) $\pm 8\text{kV}$ using the Contact Discharge method specified by IEC 61000-4-2
- 3) $\pm 15\text{kV}$ using the Air-Gap Discharge method specified by IEC 61000-4-2

ESD Test Conditions

ESD performance depends on a variety of conditions. Contact Maxim for a reliability report that documents test setup, test methodology, and test results.

Human Body Model

Figure 2a shows the Human Body Model, and Figure 2b shows the current waveform it generates when discharged into a low-impedance state. This model consists of a 100pF capacitor charged to the ESD voltage of interest that is then discharged into the test device through a $1.5\text{k}\Omega$ resistor.

IEC 61000-4-2

The IEC 61000-4-2 standard covers ESD testing and performance of finished equipment; it does not specifically refer to integrated circuits. The MAX3397E helps

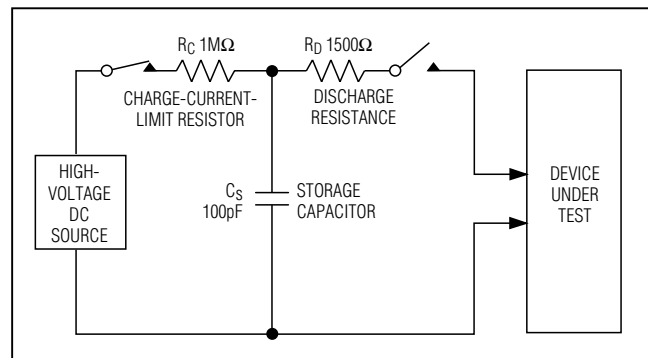

Figure 2a. Human Body ESD Test Model

Figure 2b. Human Body Current Waveform

Dual Bidirectional Low-Level Translator in μ DFN

to design equipment that meets Level 4 of IEC 61000-4-2 without the need for additional ESD-protection components.

The major difference between tests done using the Human Body Model and IEC 61000-4-2 is higher peak current in IEC 61000-4-2 because series resistance is lower in the IEC 61000-4-2 model. Hence, the ESD withstand voltage measured to IEC 61000-4-2 is generally lower than that measured using the Human Body Model. Figure 3a shows the IEC 61000-4-2 model, and Figure 3b shows the current waveform for the $\pm 8\text{kV}$, IEC 61000-4-2, Level 4, ESD contact-discharge test.

The Air-Gap test involves approaching the device with a charged probe. The contact-discharge method connects the probe to the device before the probe is energized.

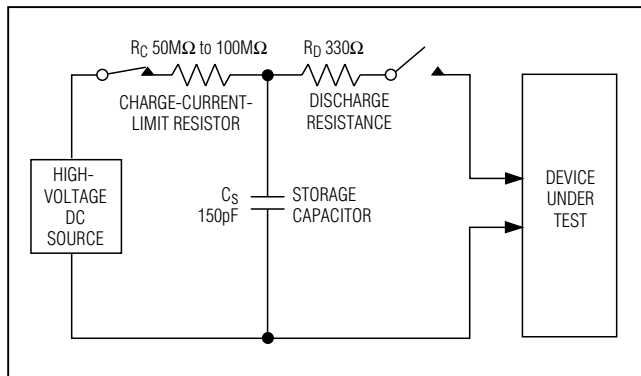

Figure 3a. IEC 61000-4-2 ESD Test Model

Figure 3b. IEC 61000-4-2 ESD Generator Current Waveform

Machine Model

The Machine Model for ESD tests all pins using a 200pF storage capacitor and zero discharge resistance. Its objective is to emulate the stress caused by contact that occurs with handling and assembly during manufacturing. Of course, all pins require this protection during manufacturing, not just inputs and outputs. Therefore, after PCB assembly, the Machine Model is less relevant to I/O ports.

Applications Information

Power-Supply Decoupling

To reduce ripple and the chance of transmitting incorrect data, bypass V_L and V_{CC} to ground with a 0.1 μ F capacitor (see the *Typical Application Circuit*). To ensure full $\pm 15\text{kV}$ ESD protection, bypass V_{CC} to ground with a 1 μ F capacitor. Place all capacitors as close as possible to the power-supply inputs.

I²C Level Translation

The MAX3397E level-shifts the data present on the I/O lines between +1.2V and +5.5V, making them ideal for level translation between a low-voltage ASIC and an I²C device. A typical application involves interfacing a low-voltage microprocessor to a 3V or 5V D/A converter, such as the MAX517.

Push-Pull vs. Open-Drain Driving

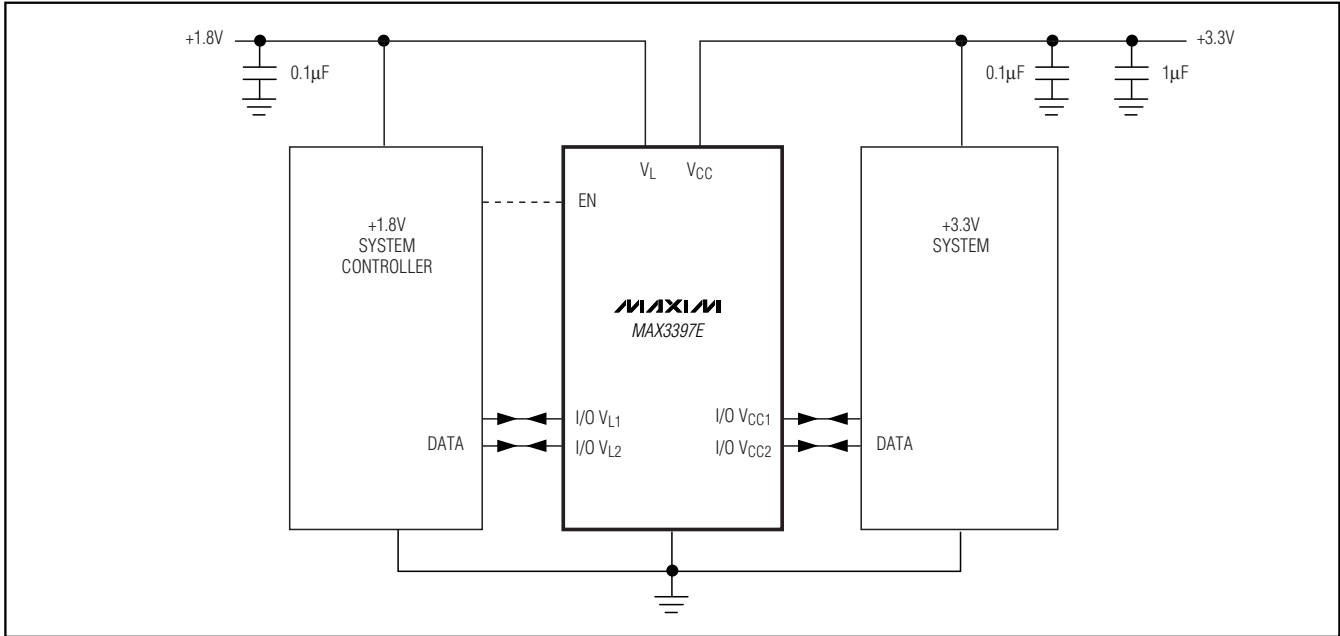

The MAX3397E can be driven in a push-pull configuration and include internal 10k Ω resistors that pull up I/O V_{L-} and I/O V_{CC-} to their respective power supplies, allowing operation of the I/O lines with open-drain devices. See the *Timing Characteristics* table for maximum data rates when using open-drain drivers.
