

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# +3.3V, Low-Jitter, Precision Clock Generator with Multiple Outputs

MAX3629

## General Description

The MAX3629 is a low-jitter precision clock generator optimized for network applications. The device integrates a crystal oscillator and a phase-locked loop (PLL) to generate high-frequency clock outputs for Ethernet applications.

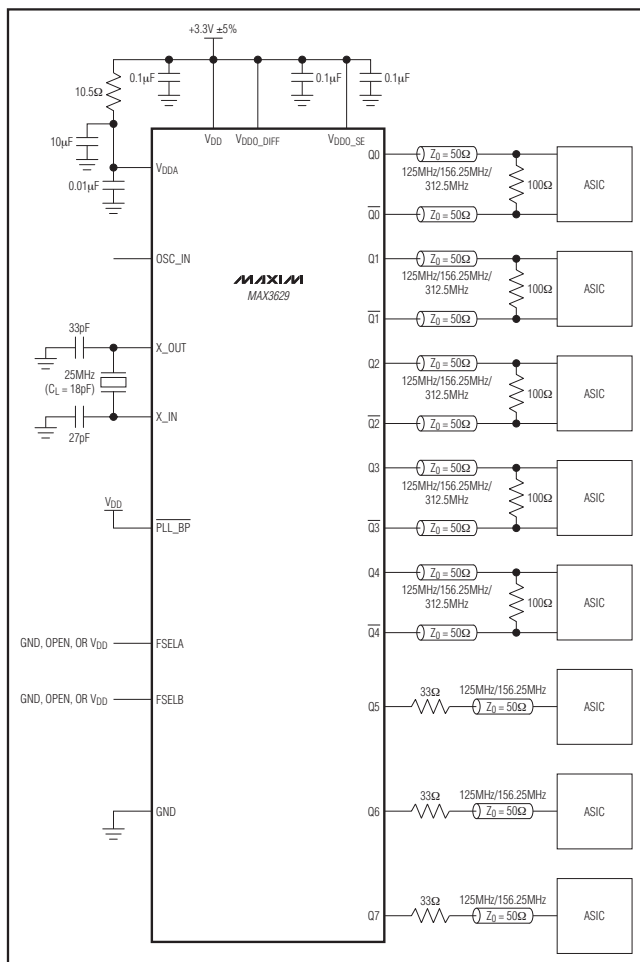

Maxim's proprietary PLL design features ultra-low jitter (0.4psRMS) and excellent power-supply noise rejection (PSNR), minimizing design risk for network equipment.

The MAX3629 contains five LVDS outputs and three LVCMOS outputs. The output frequencies are selectable among 125MHz, 156.25MHz, and 312.5MHz by pin control.

## Applications

Ethernet Networking Equipment

## Typical Operating Circuit

## Features

- ◆ **Crystal Oscillator Interface: 25MHz**
- ◆ **OSC\_IN Interface:**
  - PLL Enabled: 25MHz
  - PLL Disabled: 20MHz to 320MHz
- ◆ **Outputs:**
  - One LVDS Output at 125MHz/156.25MHz/312.5MHz (Selectable with FSELA)
  - Four LVDS Outputs at 125MHz/156.25MHz/312.5MHz (Selectable with FSELB)
  - Three LVCMOS Outputs at 125MHz/156.25MHz (Selectable with FSELB)
- ◆ **Low Phase Jitter: 0.4psRMS (12kHz to 20MHz)**
- ◆ **Excellent PSNR**
- ◆ **Operating Temperature Range: 0°C to +70°C**

## Ordering Information

+ Denotes a lead(Pb)-free/RoHS-compliant package.

\*EP = Exposed pad.

## Pin Configuration

# +3.3V, Low-Jitter, Precision Clock Generator with Multiple Outputs

## ABSOLUTE MAXIMUM RATINGS

Supply Voltage Range at V<sub>DD</sub>, V<sub>DDA</sub>,  
V<sub>DDO\_SE</sub>, V<sub>DDO\_DIFF</sub> ..... -0.3V to +4.0V  
Voltage Range at Q0, Q0, Q1, Q1, Q2, Q2,  
Q3, Q3, Q4, Q4, Q5, Q6, Q7, PLL\_BP,  
FSELA, FSELB, OSC\_IN ..... -0.3V to (V<sub>DD</sub> + 0.3V)  
Voltage Range at X\_IN Pin ..... -0.3V to +1.2V

Voltage Range at X\_OUT Pin ..... -0.3V to (V<sub>DD</sub> - 0.6V)  
Continuous Power Dissipation (T<sub>A</sub> = +70°C)  
32-Pin TQFN-EP (derate 34.5mW/°C above +70°C) ..2759mW  
Operating Junction Temperature ..... -55°C to +150°C  
Storage Temperature Range ..... -65°C to +160°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

(V<sub>DD</sub> = +3.0V to +3.6V, T<sub>A</sub> = 0°C to +70°C, unless otherwise noted. Typical values are at V<sub>DD</sub> = +3.3V, T<sub>A</sub> = +25°C, unless otherwise noted. When using X\_IN, X\_OUT input, no signal is applied at OSC\_IN. When PLL is enabled, PLL\_BP = high-Z or high. When PLL is bypassed, PLL\_BP = low.) (Note 1)

## Pin Description

PIN	NAME	FUNCTION
1	Q0	LVDS, Noninverting Clock Output
2	$\overline{Q0}$	LVDS, Inverting Clock Output
3, 9, 17, 21, 32	GND	Supply Ground
4	Q1	LVDS, Noninverting Clock Output
5	$\overline{Q1}$	LVDS, Inverting Clock Output
6, 12	VDDO_DIFF	Power Supply for Q0, Q1, Q2, Q3, and Q4 Clock Outputs. Connect to +3.3V.
7	Q2	LVDS, Noninverting Clock Output
8	$\overline{Q2}$	LVDS, Inverting Clock Output
10	Q3	LVDS, Noninverting Clock Output
11	$\overline{Q3}$	LVDS, Inverting Clock Output
13	Q4	LVDS, Noninverting Clock Output
14	$\overline{Q4}$	LVDS, Inverting Clock Output
15	RESERVED	Reserved. Connect to GND.
16	FSELB	Three-State LVCMOS/LVTTL Input. Controls the Q1 to Q7 output divider. When connected to logic-low, the output frequency is 125MHz. When connected to logic-high, the output frequency is 156.25MHz. When left open (high-Z), the output frequency is 312.5MHz. For Q5 to Q7 LVCMOS outputs, the output specification is only valid up to 160MHz.
18, 20, 22	Q5, Q6, Q7	LVCMOS Clock Output
19, 23	VDDO_SE	Power Supply for Q5, Q6, and Q7 Clock Outputs. Connect to +3.3V.
24	RESERVED	Reserved. Leave open.
25	VDDA	Analog Power Supply for the VCO. Connect to +3.3V. For additional power-supply noise filtering, this pin can connect to V <sub>DD</sub> through a 10.5Ω resistor as shown in Figure 4.
26	$\overline{\text{PLL\_BP}}$	Three-State LVCMOS/LVTTL Input (Active Low). When connected to logic-high, the PLL locks to the crystal interface (25MHz typical at X_IN and X_OUT). When left open (high-Z), the PLL locks to the OSC_IN input (25MHz typical). When connected to logic-low, the PLL is bypassed and the OSC_IN input is selected. When bypass mode is selected, the VCO/PLL is disabled to save power and eliminate intermodulation spurs.
27	VDD	Power Supply for Digital Part of the Chip. Connect to +3.3V.
28	FSELA	Three-State LVCMOS/LVTTL Input. Controls the Q0 output divider. When connected to logic-low, the output frequency is 125MHz. When connected to logic-high, the output frequency is 156.25MHz. When left open (high-Z), the output frequency is 312.5MHz.
29	OSC_IN	LVCMOS Input. Self-biased to allow AC- or DC-coupling. When $\overline{\text{PLL\_BP}}$ is open, the OSC_IN input frequency should be 25MHz. When the PLL is in bypass mode ( $\overline{\text{PLL\_BP}}$ = low), the OSC_IN input frequency can be between 20MHz and 320MHz. When $\overline{\text{PLL\_BP}}$ is high, the OSC_IN should be disconnected.
30	X_IN	Crystal Oscillator Input
31	X_OUT	Crystal Oscillator Output
—	EP	Exposed Pad. Connect to GND for proper electrical and thermal performance.

MAX3629

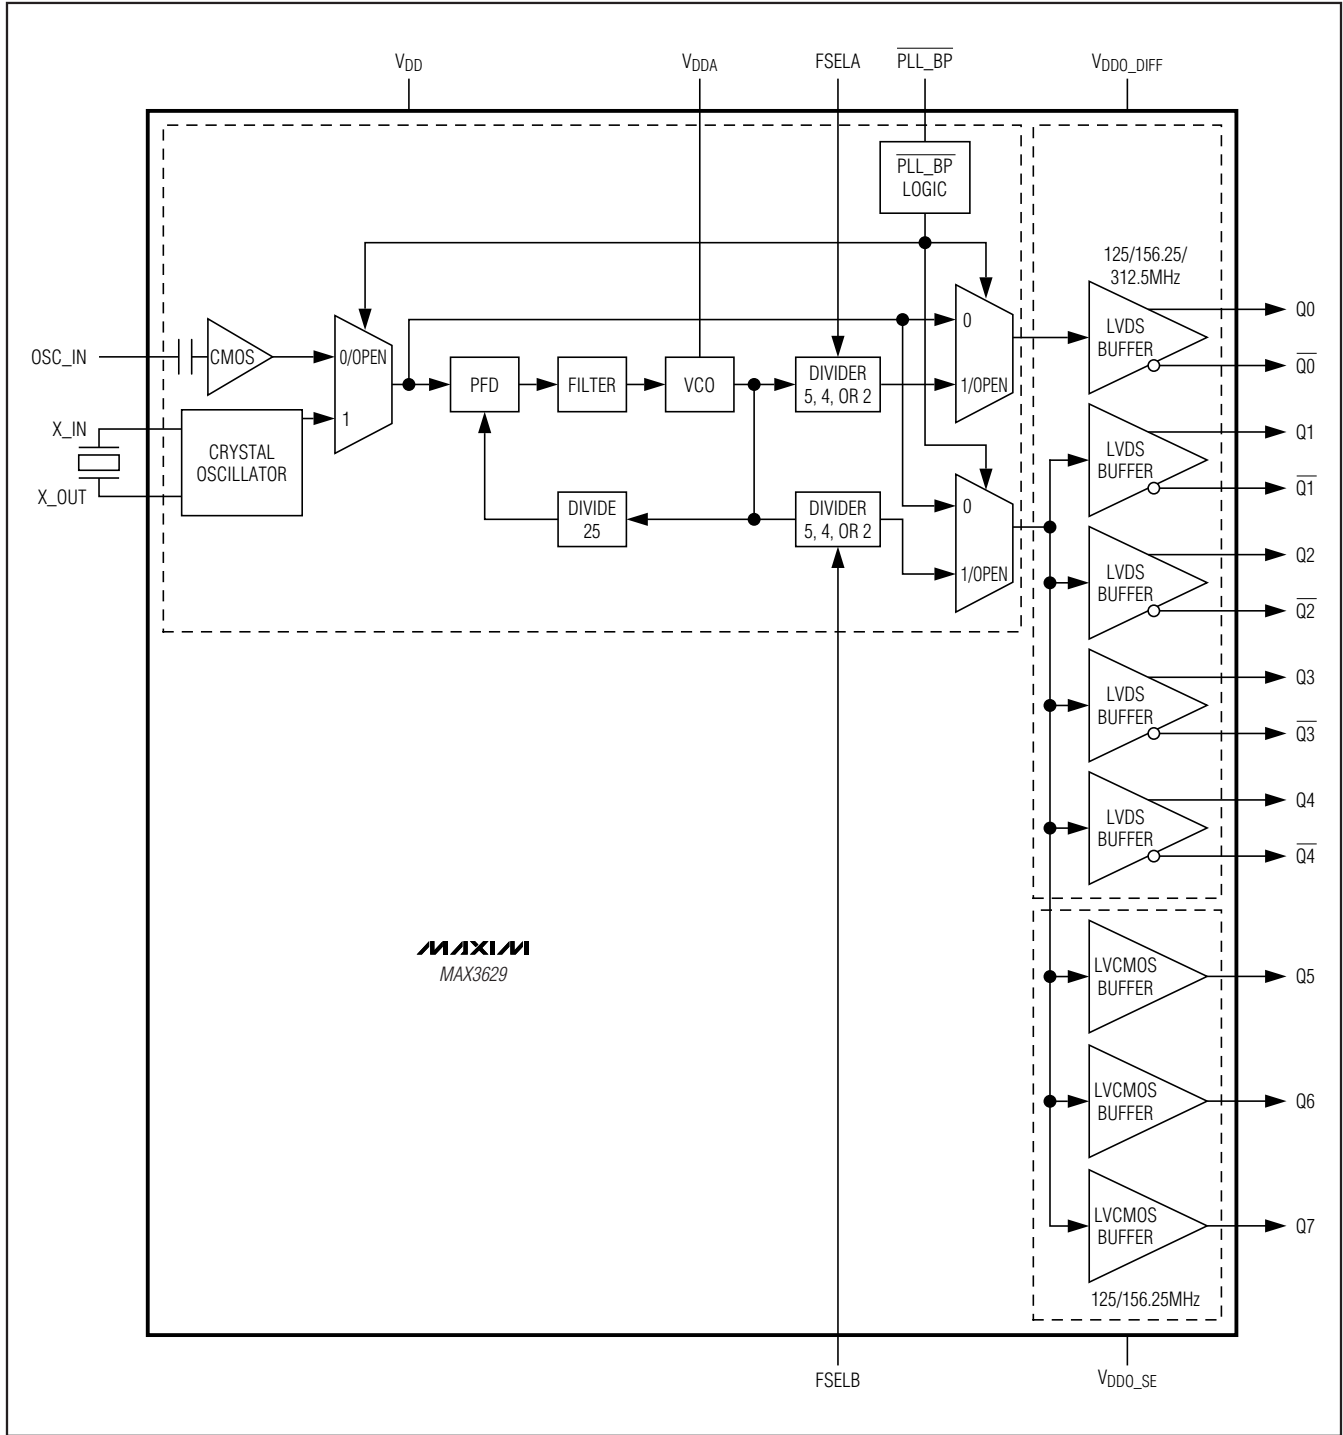

Figure 3. Functional Diagram

# +3.3V, Low-Jitter, Precision Clock Generator with Multiple Outputs

## Detailed Description

The MAX3629 is a frequency generator designed to operate at Ethernet frequencies. It consists of an on-chip crystal oscillator, PLL, LVCMOS output buffers, and LVDS output buffers. Using a low-frequency clock (crystal or CMOS input) as a reference, the internal PLL generates a high-frequency output clock with excellent jitter performance. The outputs can be switched among 125MHz, 156.25MHz, and 312.5MHz.

### Crystal Oscillator

An integrated oscillator provides the low-frequency reference clock for the PLL. This oscillator requires an external crystal connected between X\_IN and X\_OUT. The crystal frequency is 25MHz.

### OSC\_IN Buffer

The LVCMOS OSC\_IN buffer is internally biased to allow AC- or DC-coupling. This input is internally AC-coupled, and is designed to operate at 25MHz when the PLL is enabled ( $\overline{\text{PLL\_BP}}$  is left open). When the PLL is bypassed ( $\overline{\text{PLL\_BP}}$  is set low), the OSC\_IN buffer can be operated from 20MHz to 320MHz.

### PLL

The PLL takes the signal from the crystal oscillator or reference clock input and synthesizes a low-jitter, high-frequency clock. The PLL contains a phase-frequency detector (PFD), a lowpass filter, and a voltage-controlled oscillator (VCO) that operates at 625MHz. The VCO output is connected to the PFD input through a feedback divider that divides the VCO frequency by 25 to lock onto the 25MHz reference clock or oscillator. For output Q0, the FSELA pin is used to select among 125MHz, 156.25MHz, and 312.5MHz. For outputs Q1 to Q4, the FSELB pin is used to select among 125MHz, 156.25MHz, and 312.5MHz. For outputs Q5, Q6, and Q7, the FSELB pin is used to select between 125MHz and 156.25MHz. To minimize noise-induced jitter, the VCO supply ( $V_{\text{DDA}}$ ) is isolated from the core logic and output buffer supplies.

### LVDS Drivers

The high-frequency outputs—Q0, Q1, Q2, Q3, and Q4—are differential LVDS buffers designed to drive 100 $\Omega$ .

### LVCMOS Driver

LVCMOS outputs Q5, Q6, and Q7 are provided on the MAX3629. They are designed to drive single-ended high-impedance loads. The output specifications are only valid up to 160MHz.

## Applications Information

### Power-Supply Filtering

The MAX3629 is a mixed analog/digital IC. The PLL contains analog circuitry susceptible to random noise. To take full advantage of on-board filtering and noise attenuation, in addition to excellent on-chip power-supply rejection, this part provides a separate power-supply pin,  $V_{\text{DDA}}$ , for the VCO circuitry. The purpose of this design technique is to ensure clean input power supply to the VCO circuitry and to improve the overall immunity to power-supply noise. Figure 4 illustrates the recommended power-supply filter network for  $V_{\text{DDA}}$ . This network requires that the power supply is  $+3.3\text{V} \pm 5\%$ . Decoupling capacitors should be used on all other supply pins for best performance.

Figure 4. Analog Supply Filtering

### Crystal Input Layout and Frequency Stability

The MAX3629 features integrated on-chip crystal oscillators to minimize system implementation cost. The integrated crystal oscillator is a Pierce-type that uses the crystal in its parallel resonance mode. It is recommended to use a 25MHz crystal with a load specification of  $C_L = 18\text{pF}$ . The crystal frequency should be chosen so that the VCO operates at 625MHz. See Table 1 for the recommended crystal specifications.

The crystal, trace, and two external capacitors should be placed on the board as close as possible to the X\_IN and X\_OUT pins to reduce crosstalk and active signals into the oscillator.

The layout shown in Figure 5 gives approximately 2pF of trace plus footprint capacitors per side of the crystal (Y1). The dielectric material is FR-4 and dielectric thickness of the reference board is 15 mils. Using a 25MHz crystal and the capacitor values of  $C_{45} = 27\text{pF}$  and

## Interface Models

Figures 7 and 8 show examples of interface models.

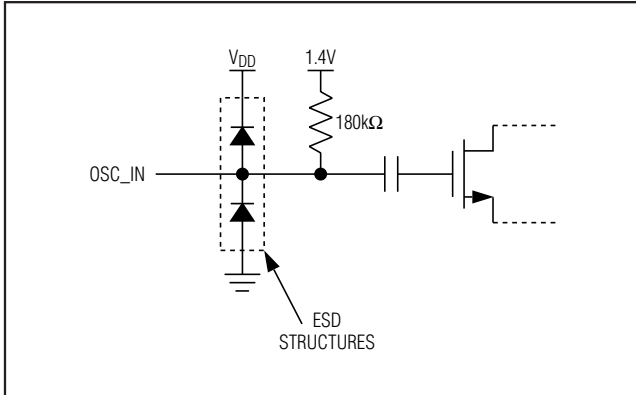

Figure 7. Simplified OSC\_IN Pin Circuit Schematic

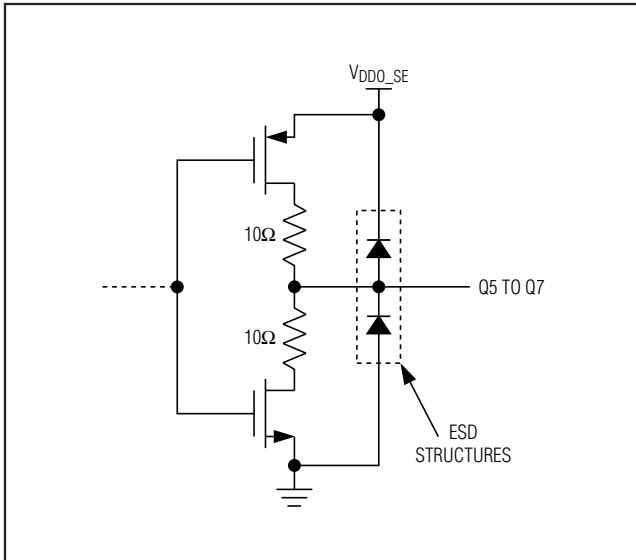

Figure 8. Simplified LVCMOS Output Circuit Schematic

## Layout Considerations

The inputs and outputs are the most critical paths for the MAX3629 and great care should be taken to minimize discontinuities on these transmission lines between the connector and the IC. Here are some suggestions for maximizing the performance of the MAX3629:

- An uninterrupted ground plane should be positioned beneath the clock outputs. The ground plane under the crystal should be removed to minimize capacitance.
- Ground pin vias should be placed close to the IC and the input/output interfaces to allow a return current path to the MAX3629 and the receive devices.
- Supply decoupling capacitors should be placed close to the supply pins, preferably on the same layer as the MAX3629.
- Take care to isolate crystal input traces from the MAX3629 outputs.
- The crystal, trace, and two external capacitors should be placed on the board as close as possible to the X\_IN and X\_OUT pins to reduce crosstalk and active signals into the oscillator.
- Maintain 100Ω differential (or 50Ω single-ended) transmission line impedance into and out of the part.
- Use good high-frequency layout techniques and multilayer boards with an uninterrupted ground plane to minimize EMI and crosstalk.

Refer to the MAX3629 evaluation kit for more information.

## Exposed-Pad Package

The exposed pad on the 32-pin TQFN package provides a very low inductance path for return current traveling to the PCB ground plane. The pad is also electrical ground on the MAX3629 and must be soldered to the circuit board ground for proper electrical performance.
