

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

330MHz, Gain of +1/Gain of +2 Closed-Loop Buffers

MAX4178/MAX4278

General Description

The MAX4178/MAX4278 are $\pm 5V$, wide-bandwidth, fast-settling, closed-loop buffers featuring high slew rate, high precision, high output current, low noise, and low differential gain and phase errors. The MAX4178, with a -3dB bandwidth of 330MHz, is preset for unity voltage gain (0dB). The MAX4278 is preset for a voltage gain of +2 (6dB) and has a 310MHz -3dB bandwidth.

The MAX4178/MAX4278 feature the high slew rate and low power that are characteristic of current-mode feedback amplifiers. However, unlike conventional current-mode feedback amplifiers, these devices have a unique input stage that combines the benefits of current-feedback topology with those of the traditional voltage-feedback topology. This combination results in low input offset voltage and bias current, low noise, and high gain precision and power-supply rejection.

The MAX4178/MAX4278 are ideally suited for driving 50Ω or 75Ω loads. They are the perfect choice for high-speed cable-driving applications, such as video routing. The MAX4178/MAX4278 are available in DIP, SO, space-saving μ MAX, and SOT23 packages.

Applications

Broadcast and High-Definition TV Systems
Video Switching and Routing
High-Speed Cable Drivers
Communications
Medical Imaging
Precision High-Speed DAC/ADC Buffers

Features

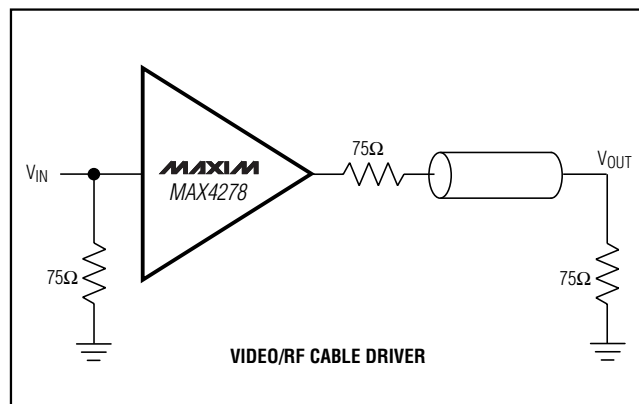

- ◆ High Speed
 - 330MHz -3dB Bandwidth (MAX4178)
 - 310MHz -3dB Bandwidth (MAX4278)
 - 250MHz Full-Power Bandwidth ($V_{OUT} = 2V_{p-p}$)
 - 150MHz 0.1dB Flatness Bandwidth
 - 1300V/ μs Slew Rate (MAX4178)
 - 1600V/ μs Slew Rate (MAX4278)
- ◆ Low Differential Phase/Gain Error: 0.01°/0.04%
- ◆ 8mA Supply Current
- ◆ 1 μA Input Bias Current
- ◆ 0.5mV Input Offset Voltage
- ◆ 5nV/ \sqrt{Hz} Input-Referred Voltage Noise
- ◆ 2pA/ \sqrt{Hz} Input-Referred Current Noise
- ◆ 1.0% Max Gain Error with 100Ω Load
- ◆ Short-Circuit Protected
- ◆ 8000V ESD Protection
- ◆ Available in Space-Saving SOT23 Package

330MHz, Gain of +1/Gain of +2 Closed-Loop Buffers

ABSOLUTE MAXIMUM RATINGS

Supply Voltage (V_{CC} to V_{EE}) 12V
 Input Voltage ($V_{CC} + 0.3V$) to ($V_{EE} - 0.3V$)
 Output Short-Circuit Duration (to GND) Continuous
 Continuous Power Dissipation ($T_A = +70^\circ\text{C}$)
 SOT23 (derate 7.10mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$) 571mW
 Plastic DIP (derate 9.09mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$) 727mW
 SO (derate 5.88mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$) 471mW
 μMAX (derate 4.10mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$) 330mW
 CERDIP (derate 8.00mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$) 640mW

Operating Temperature Ranges (Note 1)

MAX4178E_A/MAX4278E_A -40°C to $+85^\circ\text{C}$
 MAX4178EUK/MAX4278EUK -40°C to $+85^\circ\text{C}$
 MAX4178MJA/MAX4278MJA -55°C to $+125^\circ\text{C}$
 Storage Temperature Range -65°C to $+160^\circ\text{C}$
 Lead Temperature (soldering, 10s) $+300^\circ\text{C}$

Note 1: Specifications for the MAX4_78EUK (SOT23 packages) are 100% tested at $T_A = +25^\circ\text{C}$, and guaranteed by design over temperature.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

DC ELECTRICAL CHARACTERISTICS

($V_{CC} = +5V$, $V_{EE} = -5V$, $V_{OUT} = 0$, $R_L = \infty$, $T_A = T_{MIN}$ to T_{MAX} , unless otherwise noted. Typical values are at $T_A = +25^\circ\text{C}$.)

Pin Description

PIN		NAME	FUNCTION
SO/μMAX/DIP	SOT23		
1, 5, 8	—	N.C.	No Connection
2	4	GND	Ground
3	3	IN	Input
4	2	V _{EE}	Negative Power Supply. Connect to -5V.
6	1	OUT	Output
7	5	V _{CC}	Positive Power Supply. Connect to +5V.

Detailed Description

The MAX4178/MAX4278 are $\pm 5V$, wide-bandwidth, fast-settling, closed-loop buffers featuring high slew rate, high precision, high output current, low noise, and low differential gain and phase errors. The MAX4178, with a -3dB bandwidth of 330MHz, is preset for unity voltage gain (0dB). The MAX4278 is preset for a voltage gain of +2 (6dB) and has a 310MHz -3dB bandwidth.

These devices have a unique input stage that combines the benefits of a current-mode-feedback topology (high slew rate and low power) with those of a traditional voltage-feedback topology. This combination of architectures results in low input offset voltage and bias current, and high gain precision and power-supply rejection.

Under short-circuit conditions, the output current is typically limited to 150mA. This is low enough that a short to ground of any duration will not cause permanent damage to the chip. However, a short to either supply will create double the allowable power dissipation and may cause permanent damage if allowed to exist for longer than approximately 10 seconds. The high output-current capability is an advantage in systems that transmit a signal to several loads. See the *High-Performance Video Distribution Amplifier* section.

330MHz, Gain of +1/Gain of +2 Closed-Loop Buffers

Applications Information

Grounding, Bypassing, and PC Board Layout

In order to obtain the MAX4178/MAX4278s' full 330MHz/310MHz bandwidths, microstrip and stripline techniques are recommended in most cases. To ensure that the PC board does not degrade the amplifier's performance, it's a good idea to design the board for a frequency greater than 1GHz. Even with very short traces, it's good practice to use these techniques at critical points, such as inputs and outputs. Whether you use a constant-impedance board or not, observe the following guidelines when designing the board:

- Do not use wire-wrap boards. They are too inductive.
- Do not use IC sockets. They increase parasitic capacitance and inductance.
- In general, surface-mount components have shorter leads and lower parasitic reactance, giving better high-frequency performance than through-hole components.
- The PC board should have at least two layers, with one side a signal layer and the other a ground plane.
- Keep signal lines as short and straight as possible. Do not make 90° turns; round all corners.
- The ground plane should be as free from voids as possible.

On Maxim's evaluation kit, the ground plane has been removed from areas where keeping the trace capacitance to a minimum is more important than maintaining ground continuity.

Driving Capacitive Loads

The MAX4178/MAX4278 provide maximum AC performance with no output load capacitance. This is the case when the MAX4178/MAX4278 are driving a correctly terminated transmission line (e.g., a back-terminated 75Ω cable). However, the MAX4178/MAX4278 are capable of driving capacitive loads up to 100pF without oscillations, but with reduced AC performance.

Driving large capacitive loads increases the chance of oscillations in most amplifier circuits. This is especially true for circuits with high loop gains, such as voltage followers. The amplifier's output resistance and the load

capacitor combine to add a pole and excess phase to the loop response. If the frequency of this pole is low enough and if phase margin is degraded sufficiently, oscillations may occur.

A second problem when driving capacitive loads results from the amplifier's output impedance, which looks inductive at high frequency. This inductance forms an L-C resonant circuit with the capacitive load, which causes peaking in the frequency response and degrades the amplifier's gain margin.

The MAX4178/MAX4278 drive capacitive loads up to 100pF without oscillation. However, some peaking (in the frequency domain) or ringing (in the time domain) may occur. This is shown in Figures 2a and 2b and the in the Small- and Large-Signal Pulse Response graphs in the *Typical Operating Characteristics*.

To drive larger-capacitance loads or to reduce ringing, add an isolation resistor between the amplifier's output and the load, as shown in Figure 1.

The value of R_{ISO} depends on the circuit's gain and the capacitive load. Figures 3a and 3b show the Bode plots that result when a 20Ω isolation resistor is used with a voltage follower driving a range of capacitive loads. At the higher capacitor values, the bandwidth is dominated by the RC network, formed by R_{ISO} and C_L ; the bandwidth of the amplifier itself is much higher. Note that adding an isolation resistor degrades gain accuracy. The load and isolation resistor form a divider that decreases the voltage delivered to the load.

Flash ADC Preamp

The MAX4178/MAX4278s' high current-drive capability makes them well suited for buffering the low-impedance input of a high-speed flash ADC. With their low output impedance, these buffers can drive the inputs of the ADC with no loss of accuracy. Figure 4 shows a preamp for digitizing video, using the 250Mps MAX100 and the 500Mps MAX101 flash ADCs. Both of these ADCs have a 50Ω input resistance and a 1.2GHz input bandwidth.

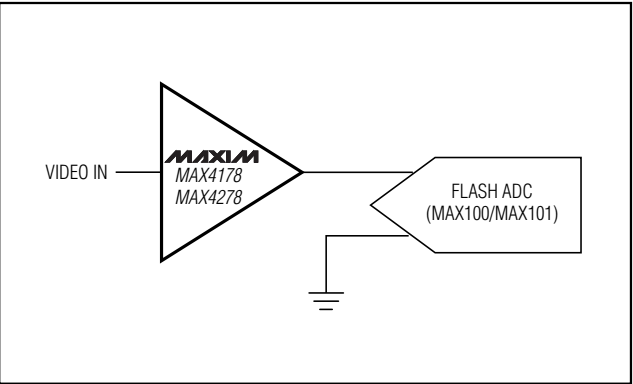

Figure 4. Preamp for Video Digitizer

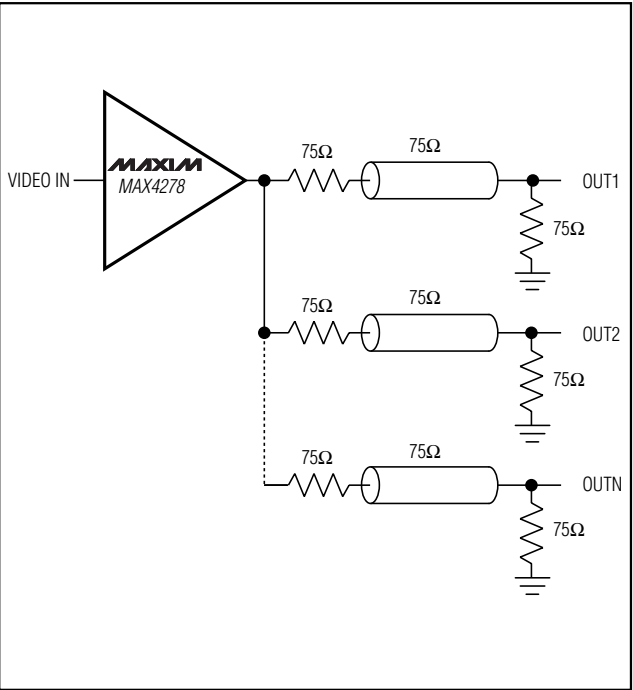

Figure 5. High-Performance Video Distribution Amplifier

High-Performance Video Distribution Amplifier

The MAX4278 ($A_V = +2$) makes an excellent driver for multiple back-terminated 75Ω video coaxial cables (Figure 5). The high current-output capability allows the attachment of up to six $\pm 2V_p$ -p, 150Ω loads to the MAX4278 at +25°C. With the output limited to $\pm 1V_p$ -p, the number of loads may double. For multiple gain-of-2 video line drivers in a single package, refer to the MAX496/MAX497 data sheet.
