

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

General Description

The MAX44290 evaluation kit (EV kit) provides a proven design to evaluate the MAX44290 low-offset, low-power, rail-to-rail I/O operational amplifier in a 6-pin wafer-level package (WLP). The EV kit circuit is preconfigured as noninverting amplifiers, but can be adapted to other topologies by changing a few components.

The EV kit comes with a MAX44290ANT+ installed.

Features

- Accommodates Multiple Op Amp Configurations
- Component Pads Allow for Sallen-Key Filter
- Accommodates Easy-to-Use Components
- Proven PCB Layout
- Fully Assembled and Tested

Quick Start

Required Equipment

- MAX44290 EV kit
- +1.8V to +5.5V, 10mA DC power supply
- Precision voltage source
- Digital multimeter

Ordering Information appears at end of data sheet.

μMAX is a registered trademark of Maxim Integrated Products, Inc.

Procedure

The EV kit is fully assembled and tested. Follow the steps below to verify board operation:

- 1) Verify that all jumpers (JU1–JU3) are in their default positions, as shown in [Table 1](#).
- 2) Set the power supply to +5V. Connect the positive terminal of the power supply to V_{DD} and the negative terminal to GND.
- 3) Connect the positive terminal of the precision voltage source to INP. Connect the negative terminal of the precision voltage source to GND. INM is already connected to GND through jumper JU1.
- 4) Connect the DMM to monitor the voltage on OUT. With the 10kΩ feedback resistors and 1kΩ series resistors, the gain of the noninverting amplifier is +11V/V.
- 5) Turn on the power supply.
- 6) Apply 100mV from the precision voltage sources. Observe the output at OUT on the DMM that reads approximately +1.1V.

Detailed Description of Hardware

The MAX44290 EV kit provides a proven layout for the MAX44290 low-power op amp. The device is a single-supply op amp that is ideal for sensor interfaces, loop-powered systems, and various types of medical and data-acquisition instruments.

The default configuration for the device in the EV kit is in a noninverting configuration.

Op-Amp Configurations

The device is a single-supply op amp that is ideal for differential sensing, noninverting amplification, buffering, and filtering. A few common configurations are shown in the next few sections.

The following sections explain how to configure the op amp.

Noninverting Configuration

The EV kit comes preconfigured as a noninverting amplifier. The gain is set by the ratio of R5 and R1. The EV kit comes preconfigured for a gain of +11V/V. The output voltage for the noninverting configuration is given by the equation below:

$$V_{OUT} = \left(1 + \frac{R5}{R1}\right) [V_{INP} \pm V_{OS}]$$

Inverting Configuration

To configure the EV kit as an inverting amplifier, remove the shunt on jumper JU1 and install a shunt on jumper JU2 and feed an input signal on the INAM PCB pad.

Differential Amplifier

To configure the EV kit as a differential amplifier, replace R1–R3 and R5 with appropriate resistors. When R1 = R2 and R3 = R5, the CMRR of the differential amplifier is determined by the matching of the resistor ratios R1/R2 and R3/R5.

$$V_{OUT} = GAIN(V_{INP} - V_{INM})$$

where:

$$GAIN = \frac{R5}{R1} = \frac{R3}{R2}$$

Sallen-Key Configuration

The Sallen-Key topology is ideal for filtering sensor signals with a second-order filter and acting as a buffer. Schematic complexity is reduced by combining the filter and buffer operations. The EV kit can be configured in a Sallen-Key topology by replacing and populating a few components. The Sallen-Key topology can be configured as a unity-gain buffer by replacing R5 with a 0Ω resistor and removing resistor R1. The signal is noninverting and applied to INAP. The filter component pads are R2–R4 and R8, where some have to be populated with resistors and others with capacitors.

Lowpass Sallen-Key Filter: To configure the Sallen-Key as a lowpass filter, remove the shunt from jumper JU1, populate the R2 and R8 pads with resistors, and populate the R3 and R4 pads with capacitors. The corner frequency and Q are then given by:

$$f_C = \frac{1}{2\pi\sqrt{R_{R2}R_{R8}C_{R3}C_{R4}}}$$

$$Q = \frac{\sqrt{R_{R2}R_{R8}C_{R3}C_{R4}}}{C_{R3}(R_{R2} + R_{R8})}$$

Highpass Sallen-Key Filter: To configure the Sallen-Key as a highpass filter, remove the shunt from jumper JU1, populate the R3 and R4 pads with resistors, and populate the R2 and R8 pads with capacitors. The corner frequency and Q are then given by:

$$f_C = \frac{1}{2\pi\sqrt{R_{R3}R_{R4}C_{R2}C_{R8}}}$$

$$Q = \frac{\sqrt{R_{R3}R_{R4}C_{R2}C_{R8}}}{R_{R4}(C_{R2} + C_{R8})}$$

Bandpass Sallen-Key Filter: To configure the Sallen-Key as a bandpass filter, remove the shunt from jumper JU1, replace R8, populate the R3 and R4 pads with resistors, and populate the C8 and R2 pads with capacitors. The corner frequency and Q are then given by:

$$f_C = \frac{1}{2\pi} \sqrt{\frac{R_{R4} + R_{R8}}{C_{C8} C_{R2} R_{R8} R_{R3} R_{R4}}}$$

$$Q = \frac{\sqrt{(R_{R4} + R_{R8}) C_{C8} C_{R2} R_{R8} R_{R3} R_{R4}}}{R_{R4} R_{R8} (C_{C8} + C_{R2}) + R_{R3} C_{R2} (R_{R4} - \frac{R_{R5} R_{R8}}{R_{R1}})}$$

Transimpedance Amplifier (TIA)

To configure the EV kit as a TIA, place a shunt on jumper JU2 and replace R1 with 0Ω resistors. The output voltage of the TIA is the input current multiplied by the feedback resistor:

$$V_{OUT} = -(I_{IN} + I_{BIAS}) \times R_{R5} \pm V_{OS}$$

where:

I_{IN} is the input current source applied at the INP test point

I_{BIAS} is the input bias current

V_{OS} is the input offset voltage of the op amp

Use a capacitor and 0Ω resistor at location R10 or R17 (and C8, if applicable) to stabilize the op amp by rolling off high-frequency gain due to a large cable capacitance.

Capacitive Loads

Some applications require driving large capacitive loads. The EV kit provides C8 and R6 pads for an optional capacitive-load driving circuit. C8 simulates the capacitive load while R6 acts as an isolation resistor to improve the op amp’s stability at higher capacitive loads. To improve the stability of the amplifier in such cases, replace R6 with a suitable resistor value to improve amplifier phase margin

Table 1. Jumper Descriptions (JU1–JU3)

JUMPER	SHUNT POSITION	DESCRIPTION
JU1	Pin 1	Disconnects INM from GND
	1-2*	Connects IN- to GND through R1 for noninverting configuration
JU2	Pin 1*	Disconnects INAP from GND
	1-2	Connects IN+ to GND through R2
JU3	1-2*	Connects \overline{SHDN} to V_{DD} to place device into normal operation
	2-3	Connects \overline{SHDN} to GND to place device into shutdown operation

*Default position.
