Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

MAXIM

Low-Voltage, CMOS Analog Multiplexers/Switches with Enable Inputs and Address Latching

MAX4530/MAX4531/MAX4532

General Description

The MAX4530/MAX4531/MAX4532 are low-voltage, CMOS analog ICs configured as an 8-channel multiplexer (mux) (MAX4530), two 4-channel muxes (MAX4531), and three single-pole/double-throw switches (MAX4532). These devices are pin compatible with the industry-standard 74HC4351/74HC4352/74HC4353. All devices have two complementary switch-enable inputs and address latching.

The MAX4530/MAX4531/MAX4532 operate from a single supply of +2V to +12V, or from dual supplies of ±2V to ±6V. On-resistance (150Ω max) is matched between switches to 8Ω max. Each switch can handle rail-to-rail analog signals. Off-leakage current is only 1nA at T_A = +25°C and 50nA at T_A = +85°C.

All digital inputs have 0.8V and 2.4V logic thresholds, ensuring both TTL- and CMOS-logic compatibility when using ±5V or a single +5V supply.

Applications

Battery-Operated Equipment

Data Acquisition

Test Equipment

Avionics

Networking

ATE Equipment

Audio-Signal Routing

*Rail-to-Rail is a registered trademark of Nippon Motorola, Ltd.*

Features

♦ **Pin Compatible with 74HC4351/74HC4352/74HC4353**

♦ **±2.0V to ±6V Dual Supplies +2.0V to +12V Single Supply**

♦ **75Ω Signal Paths with ±5V Supplies 150Ω Signal Paths with +5V Supply**

♦ **Rail-to-Rail® Signal Handling**

♦ **t_{ON} and t_{OFF} = 150ns and 120ns at ±4.5V**

♦ **<1µW Power Consumption**

♦ **>2kV ESD Protection per Method 3015.7**

♦ **TTL/CMOS-Compatible Inputs**

♦ **Small, 20-Pin SSOP/SO/DIP Packages**

Low-Voltage, CMOS Analog Multiplexers/Switches with Enable Inputs and Address Latching

ABSOLUTE MAXIMUM RATINGS

Voltages Referenced to V-
V+ ....-0.3 to +13V
Voltage into Any Terminal (Note 1)
.................-0.3 to (V+ + 0.3V) or ±20mA (whichever occurs first)
Continuous Current into Any Terminal.............................±20mA
Peak Current, NO, NC, or COM_
   (pulsed at 1ms, 10% duty cycle)..................................±40mA
ESD per Method 3015.7 ....>2000V

Continuous Power Dissipation (T$_A$ = +70°C)
   20-Pin Plastic DIP (derate 11.11mW/°C
      above +70°C)..889mW
   20-Pin SO (derate 10.00mW/°C above +70°C).............800mW
   20-Pin SSOP (derate 8.00mW/°C above +70°C) 640mW
Operating Temperature Ranges
   MAX453_C_P ....0°C to +70°C
   MAX453_E_P ....-40°C to +85°C
Storage Temperature Range ....-65°C to +150°C

Note 1: Voltages exceeding V+ or V- on any signal terminal are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Pulse Width, Latch Enable	t_{MPW}	(Note 3)	T_A = +25°C	120			ns

Note 2: The algebraic convention, where the most negative value is a minimum and the most positive value a maximum, is used in this data sheet.

Note 3: Guaranteed by design.

Note 4: ΔR_{ON} = R_{ON}(max) - R_{ON}(min).

Note 5: Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured over the specified analog signal ranges, i.e., V_{NO} = 3V to 0V and 0V to -3V.

Note 6: Leakage parameters are 100% tested at maximum-rated hot-operating temperature, and guaranteed by correlation at T_A = +25°C.

Note 7: Worst-case isolation is on channel 4 because of its proximity to the COM pin. Off isolation = 20log V_{COM} / V_{NO}, V_{COM} = output, V_{NO} = input to off switch.

**Note 8:** Leakage testing at single supply is guaranteed by correlation testing with dual supplies.

Low-Voltage, CMOS Analog Multiplexers/Switches with Enable Inputs and Address Latching

_____Applications Information

Power-Supply Considerations

Overview

The MAX4530/MAX4531/MAX4532 construction is typical of most CMOS analog switches. They have three supply pins: V+, V-, and GND. V+ and V- drive the internal CMOS switches and set the limits of the analog voltage on any switch. Reverse ESD-protection diodes are internally connected between each analog-signal pin and both V+ and V-. One of these diodes conducts if any analog signal exceeds V+ or V-. During normal operation, these and other reverse-biased ESD diodes leak, forming the only current drawn from V+ or V-.

Virtually all of the analog leakage current comes from the ESD diodes. Although the ESD diodes on a given signal pin are identical and therefore fairly well balanced, they are reverse-biased differently. Each is biased by either V+ or V- and the analog signal. This means their leakages vary as the signal varies. The difference in the two diode leakages to the V+ and V- pins constitutes the analog-signal-path leakage current. All analog leakage current flows between each pin and one of the supply terminals, not to the other switch terminal. For this reason, both sides of a given switch can show leakage currents of either the same or opposite polarity.

The analog-signal paths and GND are not connected.

V+ and GND power the internal logic and logic-level translators, and set both the input and output logic limits. The logic-level translators convert the logic levels into switched V+ and V- signals to drive the analog signals' gates. This drive signal is the only connection between the logic supplies and signals and the analog supplies. V+ and V- have ESD-protection diodes to GND.

The logic-level thresholds are TTL/CMOS compatible when V+ = +5V. As V+ rises, the threshold increases slightly, so when V+ reaches +12V, the threshold is about 3.1V—above the TTL guaranteed, high-level minimum of 2.8V, but still compatible with CMOS outputs.

Bipolar Supplies

The MAX4530/MAX4531/MAX4532 operate with bipolar supplies between ±2.0V and ±6V. The V+ and V- supplies need not be symmetrical, but their sum cannot exceed the +13V absolute maximum rating.

Single Supply

The MAX4530/MAX4531/MAX4532 operate from a single supply between +2V and +12V when V- is connected to GND. All of the bipolar precautions must be observed. At room temperature, they actually work with a single supply at, near, or below +1.7V, although as supply voltage decreases, switch on-resistance and switching times become very high.

High-Frequency Performance

In 50Ω systems, signal response is reasonably flat up to 50MHz (see _Typical Operating Characteristics_). Above 20MHz, the on response has several minor peaks that are highly layout-dependent. The problem is not in turning the switch on, but in turning it off. The off-state switch acts like a capacitor and passes higher frequencies with less attenuation. At 10MHz, off isolation is about -65dB in 50Ω systems, becoming worse (approximately 20dB per decade) as frequency increases. Higher circuit impedances also make off isolation worse. Adjacent channel attenuation is about 3dB above that of a bare IC socket, and is due entirely to capacitive coupling.

MAXIM _____

Test Circuits/Timing Diagrams
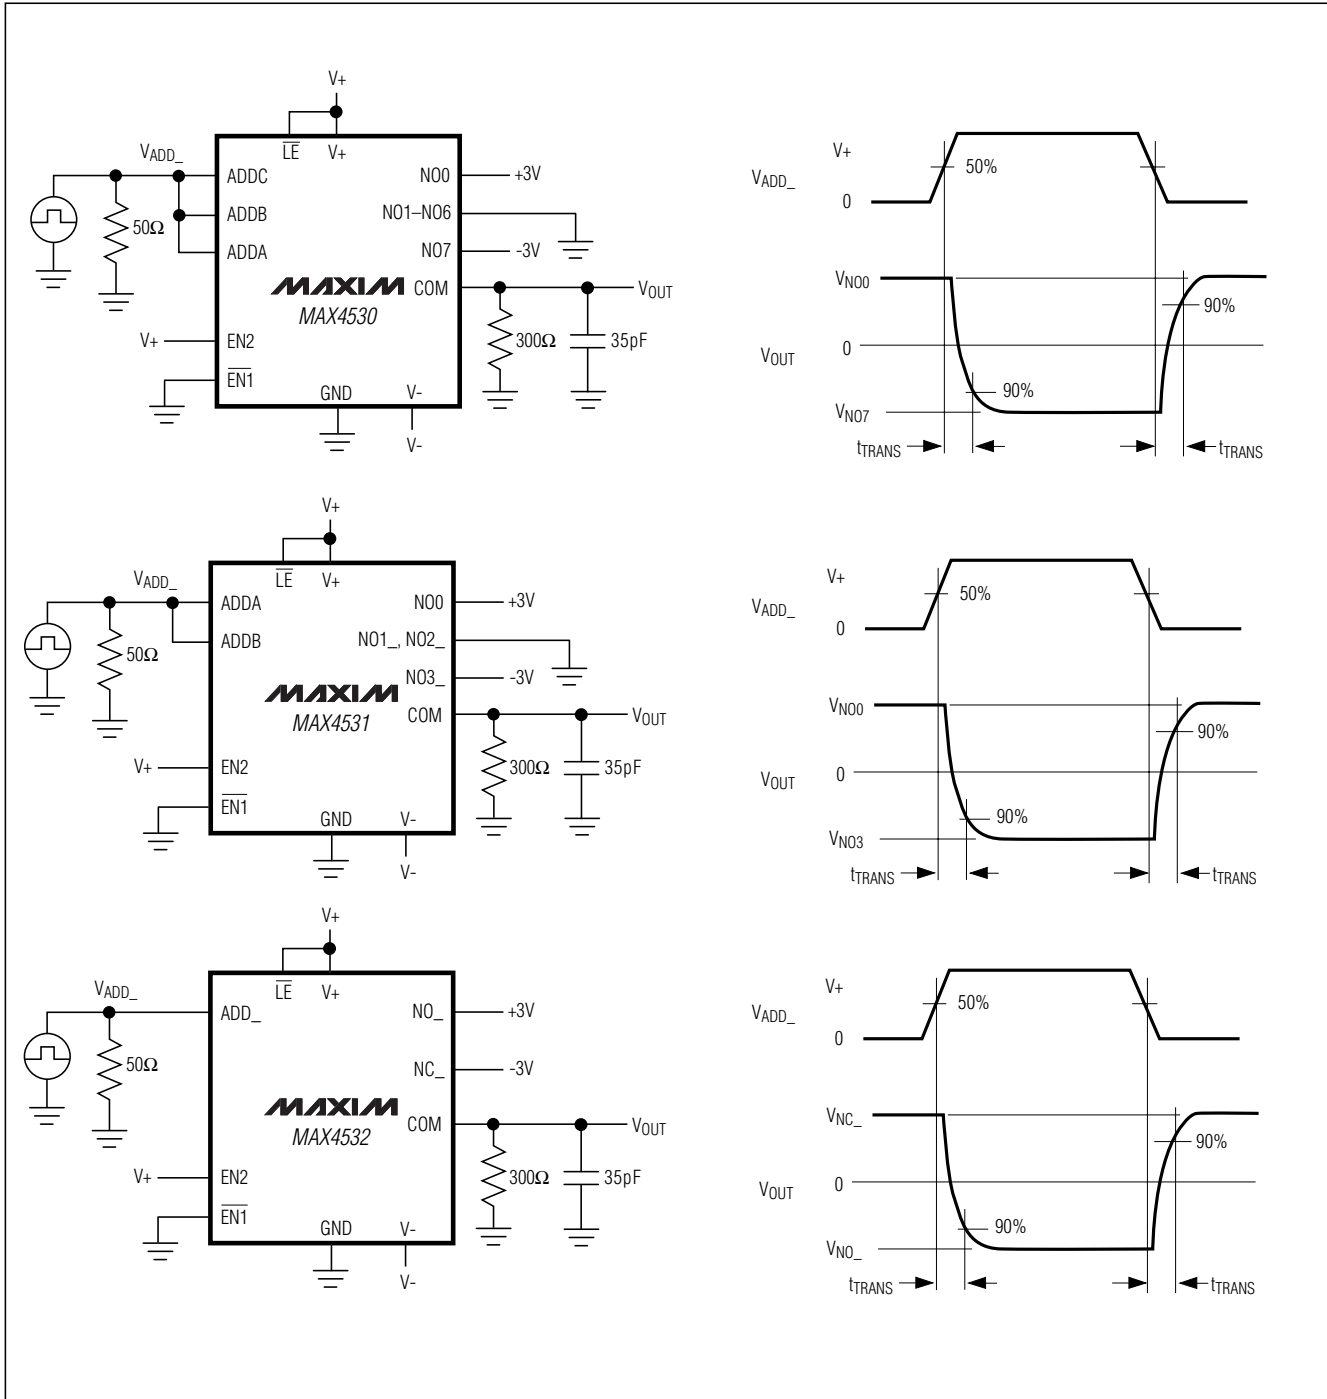

Figure 1. Address Transition Time

MAX4530/MAX4531/MAX4532

V- = 0V FOR SINGLE-SUPPLY OPERATION.
REPEAT TEST FOR EACH SECTION.
REPEAT TEST FOR EN2, WITH PULSE INVERTED
AND EN1 CONNECTED TO GND.

Figure 2. Enable Switching Time

MAX4530/MAX4531/MAX4532

V- = 0V FOR SINGLE-SUPPLY OPERATION.
REPEAT TEST FOR EACH SECTION.

Figure 3. Break-Before-Make Interval

MAX4530/MAX4531/MAX4532

Test Circuits/Timing Diagrams (continued)

ΔV_{OUT} IS THE MEASURED VOLTAGE DUE TO CHARGE-TRANSFER ERROR Q WHEN THE CHANNEL TURNS OFF.

$Q = \Delta V_{OUT} \times C_L$

V- = 0 FOR SINGLE-SUPPLY OPERATION.
REPEAT TEST FOR EACH SECTION.
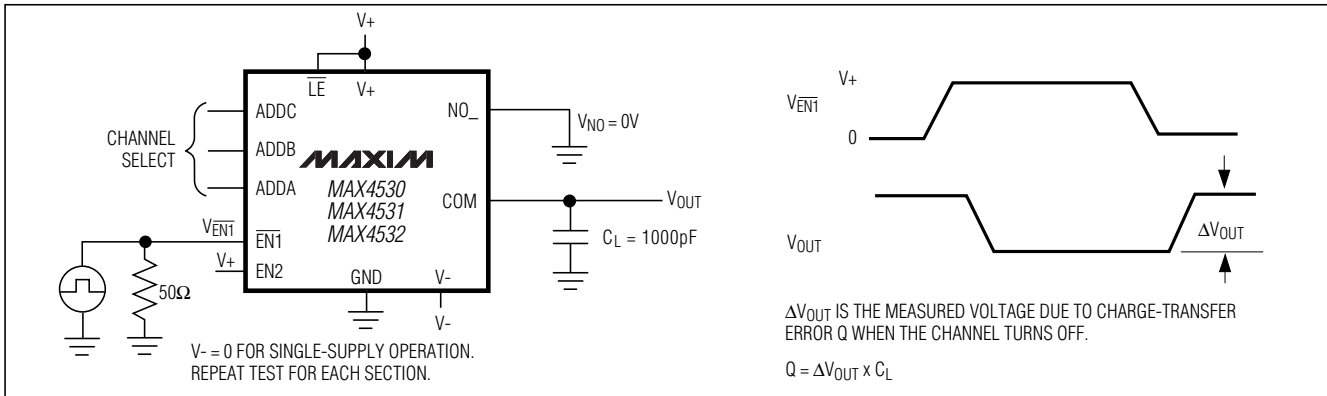

Figure 4. Charge Injection

$\text{OFF ISOLATION} = 20\log \dfrac{V_{OUT}}{V_{IN}}$

$\text{ON LOSS} = 20\log \dfrac{V_{OUT}}{V_{IN}}$

$\text{CROSSTALK} = 20\log \dfrac{V_{OUT}}{V_{IN}}$

MEASUREMENTS ARE STANDARDIZED AGAINST SHORT AT SOCKET TERMINALS.
OFF ISOLATION IS MEASURED BETWEEN COM_ AND OFF NO_ TERMINAL ON EACH SWITCH.
ON LOSS IS MEASURED BETWEEN COM_ AND ON TERMINAL ON EACH SWITCH.
CROSSTALK (MAX4531/MAX4532 IS MEASURED FROM ONE CHANNEL (A, B, C) TO ALL OTHER CHANNELS.
SIGNAL DIRECTION THROUGH SWITCH IS REVERSED; WORST VALUES ARE RECORDED.
