## : ©hipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation, and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

# Serially Controlled, 4-Channel <br> Audio/Video Multiplexers 

## General Description

The MAX4586/MAX4587 serial-interface, programmable, 4-to-1 channel multiplexers are ideal for multimedia applications. They feature $65 \Omega$ on-resistance, $4 \Omega$ onresistance matching between channels, and $5 \Omega$ onresistance flatness. Additionally, they feature -83 dB off-isolation at 20 kHz and -48 dB off-isolation at 10 MHz , with -84 dB crosstalk at 20 kHz and -60 dB crosstalk at 10 MHz .
The MAX4586 uses a 2 -wire, $I^{2} C^{T M}$-compatible serial interface; the MAX4587 uses a 3-wire, SPITM/QSPITM/ MICROWIRE ${ }^{\text {TM }}$-compatible interface. Both devices are available in 10-pin $\mu \mathrm{MAX}$ packages and are specified for the extended $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ temperature range.

Applications
Cellular Phones and Accessories
Private Mobile Radios (PMRs)
PC Multimedia Audio/Video Routing
Industrial Equipment
Set-Top Boxes
Video Conferencing
High-End Audio Equipment
${ }^{2} \mathrm{C}$ is a trademark of Philips Corp
SPI/QSPI are trademarks of Motorola, Inc.
MICROWIRE is a trademark of National Semiconductor Corp.

Features

- +2.7V to +5.5V Single-Supply Operation
- 4-to-1 Channel Multiplexer
- $65 \Omega$ (max) Ron with +5V Supply
- Audio Performance
-83dB Off-Isolation at 20kHz
-84dB Crosstalk at 20kHz
- Video Performance
-48dB Off-Isolation at 10 MHz
-60dB Crosstalk at 10 MHz
- Serial Interface

2-Wire, ${ }^{2}{ }^{2} \mathrm{C}$ Compatible (MAX4586)
3-Wire, SPI/QSPI/MICROWIRE Compatible (MAX4587)

| PART | TEMP. RANGE | PIN-PACKAGE |
| :---: | :--- | :--- |
| MAX4586EUB | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | $10 \mu \mathrm{MAX}$ |
| MAX4587EUB | $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ | $10 \mu \mathrm{MAX}$ |

Pin Configuration/ Functional Diagram

( ) ARE FOR MAX4587 ONLY.

# Serially Controlled, 4-Channel Audio/Video Multiplexers 

## ABSOLUTE MAXIMUM RATINGS

| GND | V |
| :---: | :---: |
| COM and NO_ to GND (Note 1) | .-0.3V to (V+ + 0.3V) |
| A, $\overline{C S}$, SDA, DIN, SCL, and SCLK to GND | -0.3V to +6V |
| Continuous Current into Any Terminal | $\pm 20 \mathrm{~mA}$ |
| Peak Current into Any Terminal (pulsed at $1 \mathrm{~ms}, 10 \%$ duty cycle) | $\pm 40 \mathrm{~mA}$ |

Continuous Power Dissipation $\left(\mathrm{T}_{\mathrm{A}}=+70^{\circ} \mathrm{C}\right)$
10-Pin $\mu \mathrm{MAX}$ (derate $4.1 \mathrm{~mW} /{ }^{\circ} \mathrm{C}$ above $+70^{\circ} \mathrm{C}$ ) .......... 330 mW Operating Temperature Range ........................... $-40^{\circ} \mathrm{C}$ to $+85^{\circ} \mathrm{C}$ Storage Temperature Range ............................. $65^{\circ} \mathrm{C}$ to $+150^{\circ} \mathrm{C}$ Lead Temperature (soldering, 10 sec ) ............................. $300^{\circ} \mathrm{C}$

Note 1: Signals on NO_ or COM exceeding V+ or ground are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS—Single +5V Supply

Note 2: Algebraic convention is used in this data sheet; the most negative value is shown in the minimum column.
Note 3: Guaranteed by design. Not subject to production testing.
Note 4: $\quad \Delta \operatorname{RON}=\operatorname{RON}($ MAX $)-\operatorname{RON(MIN)}$.
Note 5: Resistance flatness is defined as the difference between the maximum and minimum on-resistance values, as measured over the specified analog signal range.
Note 6: Leakage parameters are $100 \%$ tested at maximum rated temperature and guaranteed by correlation at $\mathrm{T}_{\mathrm{A}}=+25^{\circ} \mathrm{C}$.
Note 7: Off-isolation = 20log ( $\mathrm{V}_{\mathrm{COM}} / \mathrm{V}_{\mathrm{NO}}$ ) $)$, $\mathrm{V}_{\mathrm{COM}}=$ output, $\mathrm{V}_{\text {NO_ }}=$ input to off switch.
Note 8: All timing is measured from the clock's falling edge preceding the ACK signal for 2-wire and from the rising edge of $\overline{\mathrm{CS}}$ for 3 -wire. Turn-off time is defined at the output of the switch for a 0.5 V change, tested with a $300 \Omega$ load to ground. Turn-on time is defined at the output of the switch for a 0.5 V change and measured with a $5 \mathrm{k} \Omega$ load resistor to GND. All timing is shown with respect to $20 \% \mathrm{~V}+$ and $70 \% \mathrm{~V}+$, unless otherwise noted.
Note 9: Typical values are for MAX4586 devices.
Note 10: Leakage testing is guaranteed by testing with a +5.25 V supply.
Note 11: $C_{B}=$ capacitance of one bus line in pF . Tested with $C_{B}=400 \mathrm{pF}$.

## Typical Operating Characteristics

## Detailed Description

The MAX4586/MAX4587 are serial-interface, programmable multiplexers. Each device contains a 4-to-1 normally open (NO) multiplexer. Each switch is independently controlled through the on-chip serial interface. The MAX4586 uses a 2 -wire, $1^{12} \mathrm{C}$-compatible serial communications protocol, and the MAX4587 uses a 3-wire, SPI/QSPI/ MICROWIRE-compatible serial communications protocol.
These devices operate from a single +2.7 V to +5.5 V supply and are optimized for use with an audio frequency at 20 kHz and video frequencies up to 10 MHz . They feature $65 \Omega$ on-resistance, $4 \Omega$ on-resistance matching between channels, and $5 \Omega$ on-resistance flatness. Audio off-isolation is -83 dB at 20 kHz and crosstalk is at least -84 dB at 20 kHz , while video off-isolation is -48 dB at 10 MHz and crosstalk is at least -60 dB at 10 MHz .

## Applications Information

## Multiplexer Control

The MAX4586/MAX4587 have a common command-bit structure; the only difference between them is the interface type (2-wire or 3-wire, respectively).
The command controls the open/closed states of the various switches. Table 1 shows the configuration of the data bits and their related switches. After a command is issued, a logic " 1 " in any data-bit location closes the associated switch, while a logic "0" opens it (Table 2).

## 2-Wire Serial Interface

The MAX4586 uses a 2 -wire, ${ }^{2}{ }^{2}$ C-compatible serial interface. The COM_ register uses the "SendByte" protocol that consists of an address byte followed by a command byte (Table 1).
To address a given chip, the A bit in the address byte must duplicate the value present at the A pin of that chip. The rest of the address bits must match those shown in Table 3. The command byte details are described in the Switch Control section.
The 2-wire serial interface requires only two I/O lines of a standard microprocessor ( $\mu \mathrm{P}$ ) port. Figures 1 and 2 detail the timing diagram for signals on the 2-wire bus, and Tables 1 and 3 detail the format of the signals. The MAX4586 is a receive-only device and must be controlled by the bus master device. A bus master device communicates by transmitting the address byte of the slave device over the bus and then transmitting the desired information. Each transmission consists of a start condition, an address byte, a command byte, and finally a stop condition. The slave device acknowledges the recognition of its address by pulling the SDA line low for one clock period after the address byte is transmitted. The slave device also issues a similar acknowledgment after the command byte.

Figure 1. 2-Wire Serial-Interface Timing Diagram

Figure 2. Complete 2-Wire Serial-Interface Transmission

Start and Stop Conditions
The bus master signals the beginning of a transmission with a start condition by transitioning SDA from high to low while SCL is high. When the bus master has finished communicating with the slave device, it issues a stop condition by transitioning SDA from low to high while SCL is high. The bus master is then free for another transmission.

Slave Address (Address Byte)
The MAX4586 uses an 8-bit-long slave address. To select a slave address, connect A to V+ or GND. The MAX4586 has two possible slave addresses, so a maximum of two of these devices may share the same address line. The slave device MAX4586 monitors the serial bus continuously, waiting for a start condition followed by an address byte. When a slave device recog-

Figure 4. Complete 3-Wire Serial Transmission
nizes its address (01101A10), it acknowledges that it is ready for further communication by pulling the SDA line low for one clock period.

## 3-Wire Serial Interface

The MAX4587 3-wire serial interface is SPI/QSPI/ MICROWIRE compatible. An active-low chip-select ( $\overline{\mathrm{CS}}$ ) input enables the device to receive data for the serial input (DIN). Data is clocked in on the rising edge of the serial-clock (SCLK) signal. A total of 8 bits is needed in each write cycle. The first bit clocked into the MAX4587 is the command byte's MSB, and the last bit clocked in is the data byte's LSB. The first four bits
of the command byte are "don't care." While shifting data, the device remains in its original configuration. After all eight bits are clocked into the input shift register, a rising edge on $\overline{\mathrm{CS}}$ latches the data into the MAX4587 internal registers, initiating the device's change of state. Figures 3 and 4 detail the 3 -wire protocol, and Table 1 details the command byte format.

Addressable Serial Interface
To program several MAX4587s individually using a single processor, connect DIN of each MAX4587 together and control $\overline{\mathrm{CS}}$ on each MAX4587 separately. To select a particular device, drive the corresponding $\overline{\mathrm{CS}}$ low, clock in the 8-bit command, then drive $\overline{\mathrm{CS}}$ high to execute the command. Typically, only one MAX4587 is addressed at a time.

Power-Up State
The MAX4586/MAX4587 feature a preset power-up state. See Table 1 to determine the power-up state of the devices.
