

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

5Ω, Quad, SPST, CMOS Analog Switches**General Description**

The MAX4604/MAX4605/MAX4606 quad analog switches feature 5Ω max on-resistance. On-resistance is matched between switches to 0.5Ω max and is flat (0.5Ω max) over the specified signal range. Each switch can handle Rail-to-Rail® analog signals. The off-leakage current is only 2.5nA max at $+85^\circ\text{C}$. These analog switches are ideal in low-distortion applications and are the preferred solution over mechanical relays in automatic test equipment or in applications where current switching is required. These switches have low power requirements, require less board space, and are more reliable than mechanical relays.

The MAX4604 has four normally closed (NC) switches, the MAX4605 has four normally open (NO) switches, and the MAX4606 has two NC and two NO switches.

These switches operate from a single supply of $+4.5\text{V}$ to $+36\text{V}$ or from dual supplies of $\pm 4.5\text{V}$ to $\pm 20\text{V}$. All digital inputs have $+0.8\text{V}$ and $+2.4\text{V}$ logic thresholds, ensuring TTL/CMOS logic compatibility when using $\pm 15\text{V}$ supplies or a single $+12\text{V}$ supply.

Applications

Reed Relay Replacement
Test Equipment
Communication Systems

PBX, PABX Systems
Audio-Signal Routing
Avionics

Features

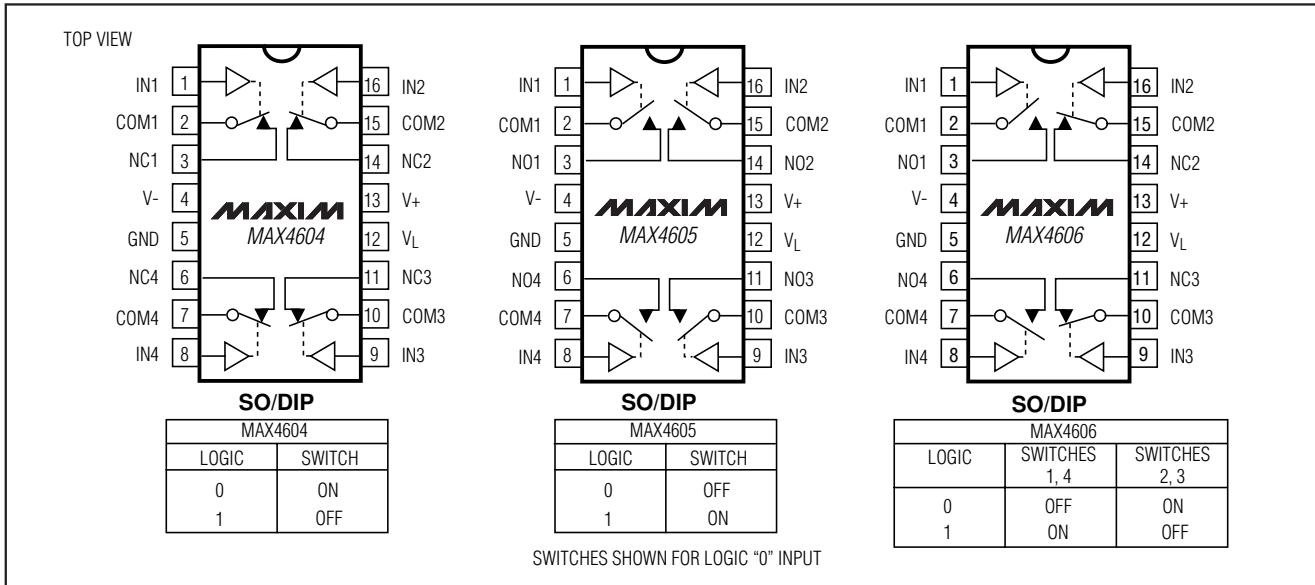

- ♦ Low On-Resistance (5Ω max)
- ♦ Guaranteed RON Match Between Channels (0.5Ω max)
- ♦ Guaranteed RON Flatness over Specified Signal Range (0.5Ω max)
- ♦ Rail-to-Rail Signal Handling
- ♦ Guaranteed ESD Protection $> 2000\text{V}$ per Method 3015.7
- ♦ Single-Supply Operation: $+4.5\text{V}$ to $+36\text{V}$
Dual-Supply Operation: $\pm 4.5\text{V}$ to $\pm 20\text{V}$
- ♦ TTL/CMOS-Compatible Control Inputs

ABSOLUTE MAXIMUM RATINGS

| | |
|--|----------------------------|
| V+ to GND | -0.3V to +44V |
| V- to GND | +0.3V to -44V |
| V+ to V-..... | -0.3V to +44V |
| V _L to GND.....(DGND - 0.3V) to (V+ + 0.3V) | |
| All Other Pins to DGND (Note 1) | (V- - 0.3V) to (V+ + 0.3V) |
| Continuous Current (COM __ , NO __ , NC __) | ±100mA |
| Peak Current (COM __ , NO __ , NC __) (pulsed at 1ms, 10% duty cycle)..... | ±300mA |

| | |
|--|-----------------|
| Continuous Power Dissipation (T _A = +70°C) | |
| 16-pin Narrow SO (derate 8.70mW/°C above +70°C) | 696mW |
| 16-pin Plastic DIP (derate 10.53mW/°C above +70°C) | 842mW |
| Operating Temperature Ranges | |
| MAX460_C_E | 0°C to +70°C |
| MAX460_E_E | -40°C to +85°C |
| Storage Temperature Range | -65°C to +160°C |
| Lead Temperature (soldering, 10sec) | +300°C |

Note 1: Signals on NC_{_}, NO_{_}, COM_{_}, or IN_{_} exceeding V+ or V- are clamped by internal diodes. Limit forward-diode current to maximum current rating.

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS—Dual Supplies

Note 2: The algebraic convention, where the most negative value is a minimum and the most positive value a maximum, is used in this data sheet.

Note 3: Guaranteed by design.

Note 4: ΔR_{ON} = R_{ON(MAX)} - R_{ON(MIN)}.

Note 5: Flatness is defined as the difference between the maximum and minimum value of on-resistance as measured over the specified analog signal range.

Note 6: Leakage parameters are 100% tested at maximum-rated hot temperature and guaranteed by correlation at +25°C.

Note 7: Off-isolation = 20log₁₀ [V_{COM_} / (V_{NC_} or V_{NO_})], V_{COM_} = output, V_{NC_} or V_{NO_} = input to off switch.

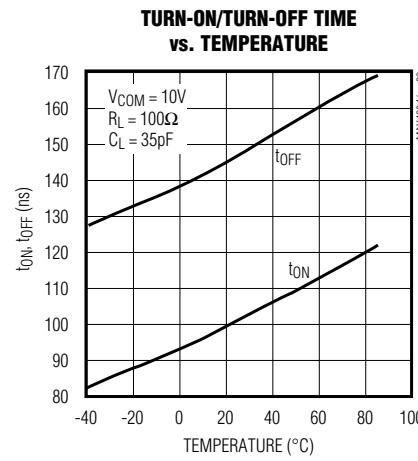

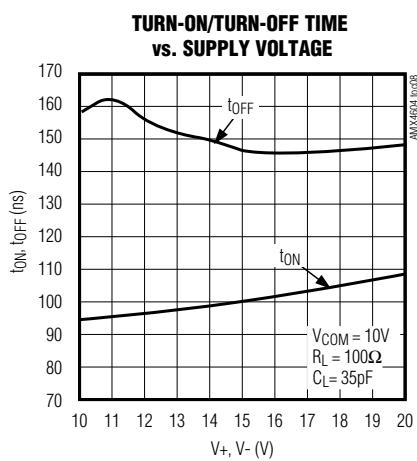

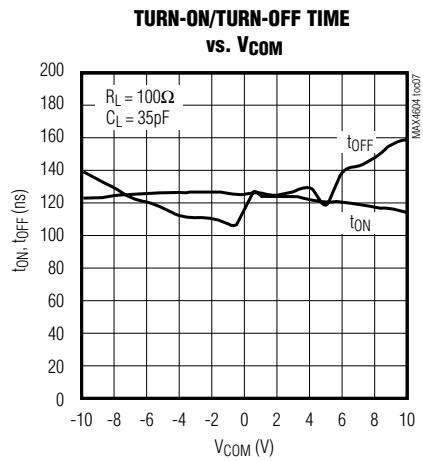

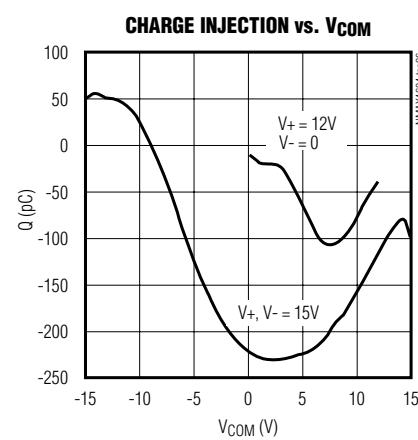

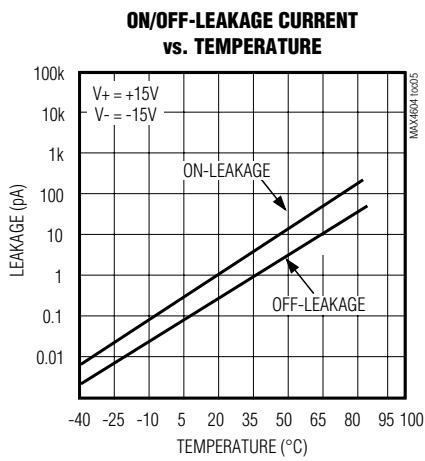

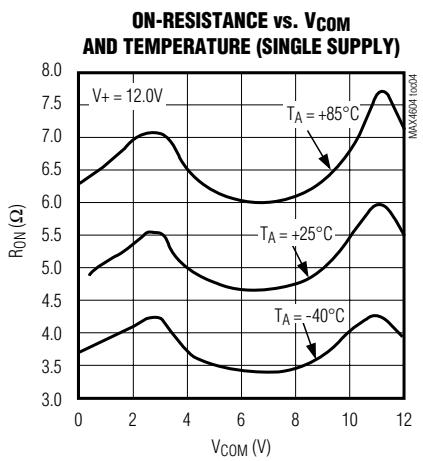

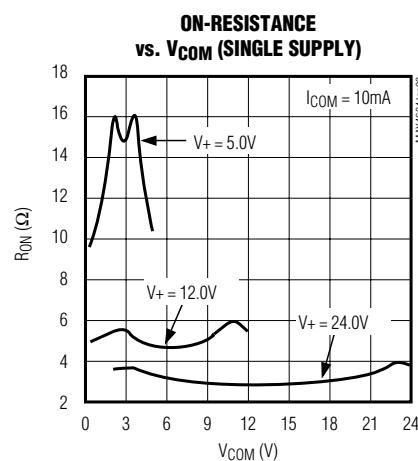

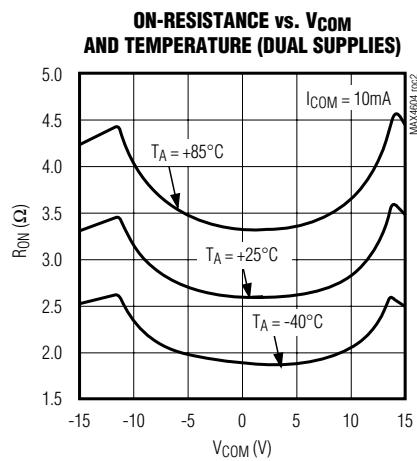

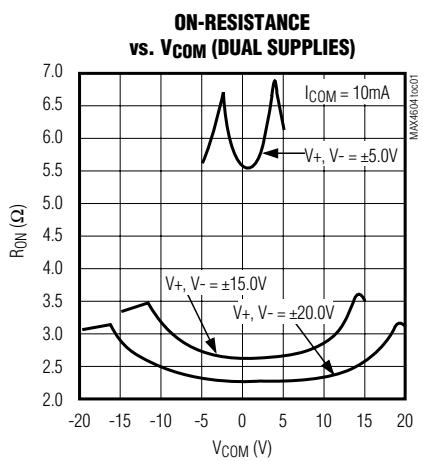

Note 8: Between any two switches.

Note 9: Leakage testing at single supply is guaranteed by testing with dual supplies.

Applications Information

Overvoltage Protection

Proper power-supply sequencing is recommended for all CMOS devices. Do not exceed the absolute maximum ratings, because stresses beyond the listed ratings can cause permanent damage to the devices. Always sequence V+ on first, then V-, followed by the logic inputs, NO, or COM. If power-supply sequencing is not possible, add two small signal diodes (D1, D2) in series with supply pins for overvoltage protection (Figure 1). Adding diodes reduces the analog signal range to one diode drop below V+ and one diode drop above V-, but does not affect the devices' low switch resistance and low leakage characteristics. Device operation is unchanged, and the difference between V+ and V- should not exceed 44V. These protection diodes are not recommended when using a single supply.

Off-Isolation at High Frequencies

In 50Ω systems, the high-frequency on-response of these parts extends from DC to above 100MHz with a typical loss of -2dB. When the switch is turned off, however, it behaves like a capacitor, and off isolation decreases with increasing frequency. (Above 300MHz, the switch actually passes more signal turned off than turned on.) This effect is more pronounced with higher source and load impedances.

Above 5MHz, circuit board layout becomes critical, and it becomes difficult to characterize the response of the

switch independent of the circuit. The graphs shown in the *Typical Operating Characteristics* were taken using a 50Ω source and load connected with BNC connectors to a circuit board deemed "average," that is, designed with isolation in mind, but not using strip-line or other special RF circuit techniques. For critical applications above 5MHz, use the MAX440, MAX441, and MAX442, which are fully characterized up to 160MHz.
