Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

MAX5813/MAX5814/MAX5815

Ultra-Small, Quad-Channel, 8-/10-/12-Bit Buffered Output DACs with Internal Reference and I²C Interface

General Description

The MAX5813/MAX5814/MAX5815 4-channel, low-power, 8-/10-/12-bit, voltage-output digital-to-analog converters (DACs) include output buffers and an internal reference that is selectable to be 2.048V, 2.500V, or 4.096V. The MAX5813/MAX5814/MAX5815 accept a wide supply voltage range of 2.7V to 5.5V with extremely low power (3mW) consumption to accommodate most low-voltage applications. A precision external reference input allows rail-to-rail operation and presents a 100kΩ (typ) load to an external reference.

The MAX5813/MAX5814/MAX5815 have an I²C-compatible, 2-wire interface that operates at clock rates up to 400kHz. The DAC output is buffered and has a low supply current of less than 250µA per channel and a low offset error of ±0.5mV (typ). On power-up, the MAX5813/MAX5814/MAX5815 reset the DAC outputs to zero, providing additional safety for applications that drive valves or other transducers which need to be off on power-up. The internal reference is initially powered down to allow use of an external reference. The MAX5813/MAX5814/MAX5815 allow simultaneous output updates using software LOAD commands or the hardware load DAC logic input (LDAC).

A clear logic input (CLR) allows the contents of the CODE and the DAC registers to be cleared asynchronously and sets the DAC outputs to zero. The MAX5813/MAX5814/MAX5815 are available in a 14-pin TSSOP and an ultra-small, 12-bump WLP package and are specified over the -40°C to +125°C temperature range.

Applications

Programmable Voltage and Current Sources

Gain and Offset Adjustment

Automatic Tuning and Optical Control

Power Amplifier Control and Biasing

Process Control and Servo Loops

Portable Instrumentation

Data Acquisition

Ordering Information appears at end of data sheet.

Benefits and Features

♦ **Four High-Accuracy DAC Channels**
 ◇ **12-Bit Accuracy Without Adjustment**
 ◇ **±1 LSB INL Buffered Voltage Output**
 ◇ **Guaranteed Monotonic Over All Operating Conditions**
 ◇ **Independent Mode Settings for Each DAC**

♦ **Three Precision Selectable Internal References**
 ◇ **2.048V, 2.500V, or 4.096V**

♦ **Internal Output Buffer**
 ◇ **Rail-to-Rail Operation with External Reference**
 ◇ **4.5µs Settling Time**
 ◇ **Outputs Directly Drive 2kΩ Loads**

♦ **Small 5mm x 4.4mm 14-Pin TSSOP or Ultra-Small 1.6mm x 2.2mm 12-Bump WLP Package**

♦ **Wide 2.7V to 5.5V Supply Range**

♦ **Separate 1.8V to 5.5V V$_{DDIO}$ Power-Supply Input**

♦ **Fast 400kHz I²C-Compatible, 2-Wire Serial Interface**

♦ **Power-On-Reset to Zero-Scale DAC Output**

♦ **LDAC and CLR For Asynchronous Control**

♦ **Three Software-Selectable Power-Down Output Impedances**
 ◇ **1kΩ, 100kΩ, or High Impedance**

Ultra-Small, Quad-Channel, 8-/10-/12-Bit Buffered Output DACs with Internal Reference and I²C Interface

ABSOLUTE MAXIMUM RATINGS

V_{DD}, V_{DDIO} to GND .... -0.3V to +6V
OUT_, REF to GND....0.3V to the lower of (V_{DD} + 0.3V) and +6V
SCL, SDA, $\overline{LDAC}$, $\overline{CLR}$ to GND .... -0.3V to +6V
ADDR_ to GND..-0.3V to the lower of
(V_{DDIO} + 0.3V) and +6V
Continuous Power Dissipation (T_A = +70°C)
   TSSOP (derate at 10mW/°C above 70°C)...................797mW
   WLP (derate at 16.1mW/°C above 70°C).................1288mW

Maximum Continuous Current into Any Pin .... ±50mA
Operating Temperature Range .... -40°C to +125°C
Storage Temperature Range........................... -65°C to +150°C
Lead Temperature (TSSOP only)(soldering, 10s)...........+300°C
Soldering Temperature (reflow) .... +260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

PACKAGE THERMAL CHARACTERISTICS (Note 1)

TSSOP
   Junction-to-Ambient Thermal Resistance (θ_{JA}) ....100°C/W
   Junction-to-Case Thermal Resistance (θ_{JC}) ....30°C/W

WLP
   Junction-to-Ambient Thermal Resistance (θ_{JA})
   (Note 2)...62°C/W

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to **www.maximintegrated.com/thermal-tutorial**.
Note 2: Visit **www.maximintegrated.com/app-notes/index.mvp/id/1891** for information about the thermal performance of WLP packaging.

ELECTRICAL CHARACTERISTICS

(V_{DD} = 2.7V to 5.5V, V_{DDIO} = 1.8V to 5.5V, V_{GND} = 0V, C_L = 200pF, R_L = 2kΩ, T_A = -40°C to +125°C, unless otherwise noted. Typical values are at T_A = +25°C.) (Note 3)

$\overline{CLR}$ Removal Time Prior to a Recognized START	t_{CLRSTA}		100			ns
$\overline{CLR}$ Pulse Width Low	t_{CLPW}		20			ns
$\overline{LDAC}$ Pulse Width Low	t_{LDPW}		20			ns
SCLK Rise to $\overline{LDAC}$ Fall to Hold	t_{LDH}	Applies to execution edge	400			ns

Ultra-Small, Quad-Channel, 8-/10-/12-Bit Buffered Output DACs with Internal Reference and I²C Interface

ELECTRICAL CHARACTERISTICS (continued)

(V_{DD} = 2.7V to 5.5V, V_{DDIO} = 1.8V to 5.5V, V_{GND} = 0V, C_L = 200pF, R_L = 2kΩ, T_A = -40°C to +125°C, unless otherwise noted. Typical values are at T_A = +25°C.) (Note 3)

Note 3: Electrical specifications are production tested at T_A = +25°C. Specifications over the entire operating temperature range are guaranteed by design and characterization. Typical specifications are at T_A = +25°C and are not guaranteed.
Note 4: DC Performance is tested without load.
Note 5: Linearity is tested with unloaded outputs to within 20mV of GND and V_{DD}.
Note 6: Offset and gain errors are calculated from measurements made with V_{REF} = V_{DD} at code 30 and 4065 for MAX5815, code 8 and 1016 for MAX5814, and code 2 and 254 for MAX5813.
Note 7: Subject to zero and full-scale error limits and V_{REF} settings.
Note 8: Measured with all other DAC outputs at midscale with one channel transitioning 0 to full scale.
Note 9: On power-up, the device initiates an internal 200µs (typ) calibration sequence. All commands issued during this time will be ignored.
Note 10: Guaranteed by design.
Note 11: All channels active at V_{FS}, unloaded. Static logic inputs with V_{IL} = V_{GND} and V_{IH} = V_{DDIO}.
Note 12: An unconnected condition on the ADDR_ pins is sensed via a resistive pullup and pulldown operation; for proper operation, ADDR_ pins should be tied to V_{DDIO}, GND, or left unconnected with minimal capacitance.

Ultra-Small, Quad-Channel, 8-/10-/12-Bit Buffered Output DACs with Internal Reference and I²C Interface

Detailed Description

The MAX5813/MAX5814/MAX5815 are 4-channel, low-power, 8-/10-/12-bit buffered voltage-output DACs. The 2.7V to 5.5V wide supply voltage range and low-power consumption accommodates most low-power and low-voltage applications. The devices present a 100kΩ load to the external reference. The internal output buffers allow rail-to-rail operation. An internal voltage reference is available with software selectable options of 2.048V, 2.5V, or 4.096V. The devices feature a fast 400kHz I²C-compatible interface. The MAX5813/MAX5814/MAX5815 include a serial-in/parallel-out shift register, internal CODE and DAC registers, a power-on-reset (POR) circuit to initialize the DAC outputs to code zero, and control logic. $\overline{\text{CLR}}$ is available to asynchronously clear the device independent of the serial interface.

DAC Outputs (OUT_)

The MAX5813/MAX5814/MAX5815 include internal buffers on all DAC outputs. The internal output buffers provide improved load regulation for the DAC outputs. The output buffers slew at 1V/μs (typ) and drive up to 2kΩ in parallel with 500pF. The analog supply voltage (V_{DD}) determines the maximum output voltage range of the devices as V_{DD} powers the output buffer. Under no-load conditions, the output buffers drive from GND to V_{DD}, subject to offset and gain errors. With a 2kΩ load to GND, the output buffers drive from GND to within 200mV of V_{DD}. With a 2kΩ load to V_{DD}, the output buffers drive from V_{DD} to within 200mV of GND.

The DAC ideal output voltage is defined by:

$$V_{OUT} = V_{REF} \times \frac{D}{2^N}$$

where D = code loaded into the DAC register, V_{REF} = reference voltage, N = resolution.

Internal Register Structure

The user interface is separated from the DAC logic to minimize digital feedthrough. Within the serial interface is an input shift register, the contents of which can be routed to control registers, individual, or multiple DACs as determined by the user command.

Within each DAC channel there is a CODE register followed by a DAC latch register (see the *Detailed Functional Diagram*). The contents of the CODE register hold pending DAC output settings which can later be loaded into the DAC registers. The CODE register can be updated using both CODE and CODE_LOAD user commands. The contents of the DAC register hold the current DAC output settings. The DAC register can be updated directly from the serial interface using the CODE_LOAD commands or can upload the current contents of the CODE register using LOAD commands or the $\overline{\text{LDAC}}$ hardware pin.

The contents of both CODE and DAC registers are maintained during power-down states, so that when the DACs are powered on, they return to their previously stored output settings. Any CODE or LOAD commands issued during power-down states continue to update the register contents. SW_CLEAR and SW_RESET commands reset the contents of all CODE and DAC registers to their zero-scale defaults.

Internal Reference

The MAX5813/MAX5814/MAX5815 include an internal precision voltage reference that is software selectable to be 2.048V, 2.500V, or 4.096V. When an internal reference is selected, that voltage is available on the REF pin for other external circuitry (see Figure 9) and can drive a 25kΩ load.

External Reference

The external reference input has a typical input impedance of 100kΩ and accepts an input voltage from +1.24V to V_{DD}. Connect an external voltage supply between REF and GND to apply an external reference. The MAX5813/MAX5814/MAX5815 power up and reset to external reference mode. Visit **www.maximintegrated.com/products/references** for a list of available external voltage-reference devices.

Load DAC ($\overline{\text{LDAC}}$) Input

The MAX5813/MAX5814/MAX5815 feature an active-low $\overline{\text{LDAC}}$ logic input that allows the outputs to update asynchronously. Connect $\overline{\text{LDAC}}$ to V_{DDIO} or keep $\overline{\text{LDAC}}$ high during normal operation when the device is controlled only through the serial interface. Drive $\overline{\text{LDAC}}$ low to simultaneously update the DAC outputs with data from the CODE registers. Holding $\overline{\text{LDAC}}$ low causes the DAC registers to become transparent and CODE data is passed through to the DAC registers immediately updating the DAC outputs. A software CONFIG command can be used to configure the $\overline{\text{LDAC}}$ operation of each DAC independently.

Ultra-Small, Quad-Channel, 8-/10-/12-Bit Buffered Output DACs with Internal Reference and I^{2}C Interface

Clear Input ($\overline{CLR}$)

The MAX5813/MAX5814/MAX5815 feature an asynchronous active-low $\overline{CLR}$ logic input that simultaneously sets all four DAC outputs to zero. Driving $\overline{CLR}$ low clears the contents of both the CODE and DAC registers and also aborts the on-going I^{2}C command. To allow a new I^{2}C command, drive $\overline{CLR}$ high, satisfying the t_{CLRSTA} timing requirement.

Interface Power Supply (V$_{DDIO}$)

The MAX5813/MAX5814/MAX5815 feature a separate supply pin (V$_{DDIO}$) for the digital interface (1.8V to 5.5V). Connect V$_{DDIO}$ to the I/O supply of the host processor.

I^{2}C Serial Interface

The MAX5813/MAX5814/MAX5815 feature an I^{2}C-/SMBus™-compatible, 2-wire serial interface consisting of a serial data line (SDA) and a serial clock line (SCL). SDA and SCL enable communication between the MAX5813/MAX5814/MAX5815 and the master at clock rates up to 400kHz. Figure 1 shows the 2-wire interface timing diagram. The master generates SCL and initiates data transfer on the bus. The master device writes data to the MAX5813/MAX5814/MAX5815 by transmitting the proper slave address followed by the command byte and then the data word. Each transmit sequence is framed by a START (S) or Repeated START (Sr) condition and a STOP (P) condition. Each word transmitted to the MAX5813/MAX5814/MAX5815 is 8 bits long and is followed by an acknowledge clock pulse. A master reading data from the MAX5813/MAX5814/MAX5815 must transmit the proper slave address followed by a series of nine SCL pulses for each byte of data requested. The MAX5813/MAX5814/MAX5815 transmit data on SDA in sync with the master-generated SCL pulses. The master acknowledges receipt of each byte of data. Each read sequence is framed by a START or Repeated START condition, a not acknowledge, and a STOP condition. SDA operates as both an input and an open-drain output. A pullup resistor, typically 4.7kΩ is required on SDA. SCL operates only as an input. A pullup resistor, typically 4.7kΩ, is required on SCL if there are multiple masters on the bus, or if the single master has an open-drain SCL output.

Series resistors in line with SDA and SCL are optional. Series resistors protect the digital inputs of the MAX5813/MAX5814/MAX5815 from high voltage spikes on the bus lines and minimize crosstalk and undershoot of the bus
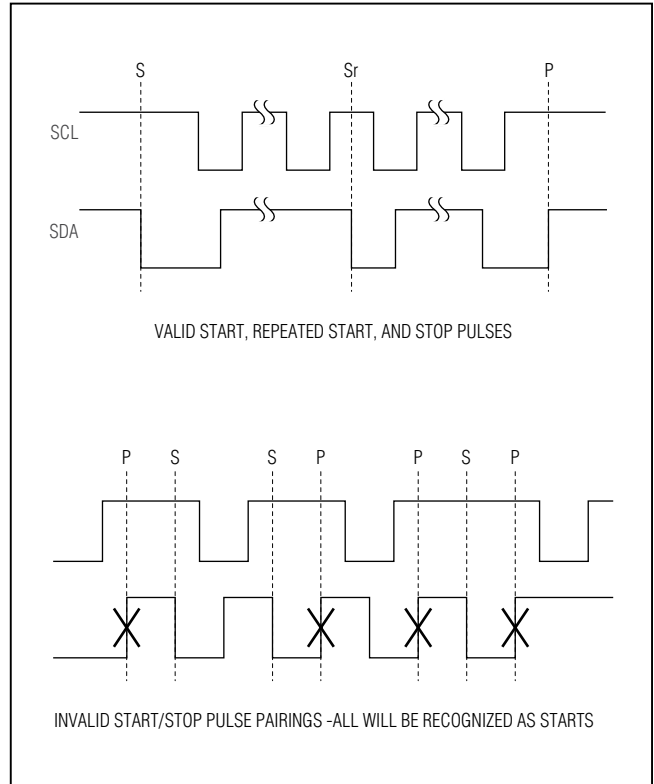

Figure 2. I^{2}C START, Repeated START, and STOP Conditions

signals. The MAX5813/MAX5814/MAX5815 can accommodate bus voltages higher than V$_{DDIO}$ up to a limit of 5.5V; bus voltages lower than V$_{DDIO}$ are not recommended and may result in significantly increased interface currents. The MAX5813/MAX5814/MAX5815 digital inputs are double buffered. Depending on the command issued through the serial interface, the CODE register(s) can be loaded without affecting the DAC register(s) using the write command. To update the DAC registers, either drive the $\overline{LDAC}$ input low to asynchronously update all DAC outputs, or use the software LOAD command.

I^{2}C START and STOP Conditions

SDA and SCL idle high when the bus is not in use. A master initiates communication by issuing a START condition. A START condition is a high-to-low transition on SDA with SCL high. A STOP condition is a low-to-high transition on SDA while SCL is high (Figure 2). A START condition from the master signals the beginning of a transmission

SMBus is a trademark of Intel Corp.

Ultra-Small, Quad-Channel, 8-/10-/12-Bit Buffered Output DACs with Internal Reference and I²C Interface

to the MAX5813/MAX5814/MAX5815. The master terminates transmission and frees the bus, by issuing a STOP condition. The bus remains active if a Repeated START condition is generated instead of a STOP condition.

I²C Early STOP and Repeated START Conditions

The MAX5813/MAX5814/MAX5815 recognize a STOP condition at any point during data transmission except if the STOP condition occurs in the same high pulse as a START condition. Transmissions ending in an early STOP condition will not impact the internal device settings. If the STOP occurs during a readback byte, the transmission is terminated and a later read mode request will begin transfer of the requested register data from the beginning (this applies to combined format I²C read mode transfers only, interface verification mode transfers will be corrupted). See Figure 2.

I²C Slave Address

The slave address is defined as the seven most significant bits (MSBs) followed by the R/$\overline{W}$ bit. See Figure 4. For the TSSOP packages, the three most significant bits are 001 with the 4 LSBs determined by ADDR1 and ADDR0 as shown in Table 1. For the WLP package, the five most significant bits are 00011 with the 2 LSBs determined by ADDR0 as shown in Table 2. Setting the R/$\overline{W}$ bit to 1 configures the MAX5813/MAX5814/MAX5815 for read mode. Setting the R/$\overline{W}$ bit to 0 configures the MAX5813/MAX5814/MAX5815 for write mode. The slave address is the first byte of information sent to the MAX5813/MAX5814/MAX5815 after the START condition.

The MAX5813/MAX5814/MAX5815 have the ability to detect an unconnected state on the ADDR input for additional address flexibility; if leaving the ADDR input unconnected, be certain to minimize all loading on the pin (i.e. provide a landing for the pin, but do not allow any board traces).

I²C Broadcast Address

A broadcast address is provided for the purpose of updating or configuring all MAX5813/MAX5814/MAX5815 devices on a given I²C bus. All MAX5813/MAX5814/MAX5815 devices acknowledge and respond to the broadcast device address 00010000. The devices will respond to the broadcast address, regardless of the state of the address pins. The broadcast mode is intended for use in write mode only (as indicated by R/$\overline{W}$ = 0 in the address given).

I²C Acknowledge

In write mode, the acknowledge bit (ACK) is a clocked 9th bit that the MAX5813/MAX5814/MAX5815 use to handshake receipt of each byte of data as shown in Figure 3. The MAX5813/MAX5814/MAX5815 pull down SDA during the entire master-generated 9th clock pulse if the previous byte is successfully received. Monitoring ACK allows for detection of unsuccessful data transfers. An unsuccessful data transfer occurs if a receiving device is busy or if a system fault has occurred. In the event of an unsuccessful data transfer, the bus master will retry communication.

In read mode, the master pulls down SDA during the 9th clock cycle to acknowledge receipt of data from the MAX5813/MAX5814/MAX5815. An acknowledge is sent by the master after each read byte to allow data transfer to continue. A not-acknowledge is sent when the master reads the final byte of data from the MAX5813/MAX5814/MAX5815, followed by a STOP condition.

I²C Command Byte and Data Bytes

A command byte follows the slave address. A command byte is typically followed by two data bytes unless it is the last byte in the transmission. If data bytes follow the command byte, the command byte indicates the address of the register that is to receive the following two data bytes. The data bytes are stored in a temporary register and then transferred to the appropriate register during the ACK periods between bytes. This avoids any glitching or digital feedthrough to the DACs while the interface is active.

I²C Write Operations

A master device communicates with the MAX5813/MAX5814/MAX5815 by transmitting the proper slave address followed by command and data words. Each transmit sequence is framed by a START or Repeated START condition and a STOP condition as described above. Each word is 8 bits long and is always followed by an acknowledge clock (ACK) pulse as shown in the Figure 4 and Figure 5. The first byte contains the address of the MAX5813/MAX5814/MAX5815 with R/$\overline{W}$ = 0 to indicate a write. The second byte contains the register (or command) to be written and the third and fourth bytes contain the data to be written. By repeating the register address plus data pairs (Byte #2 through Byte #4 in Figure 4 and Figure 5), the user can perform multiple register writes using a single I²C command sequence. There is no limit as to how many registers the user can write with a single command. The MAX5813/MAX5814/MAX5815 support this capability for all user-accessible write mode commands.
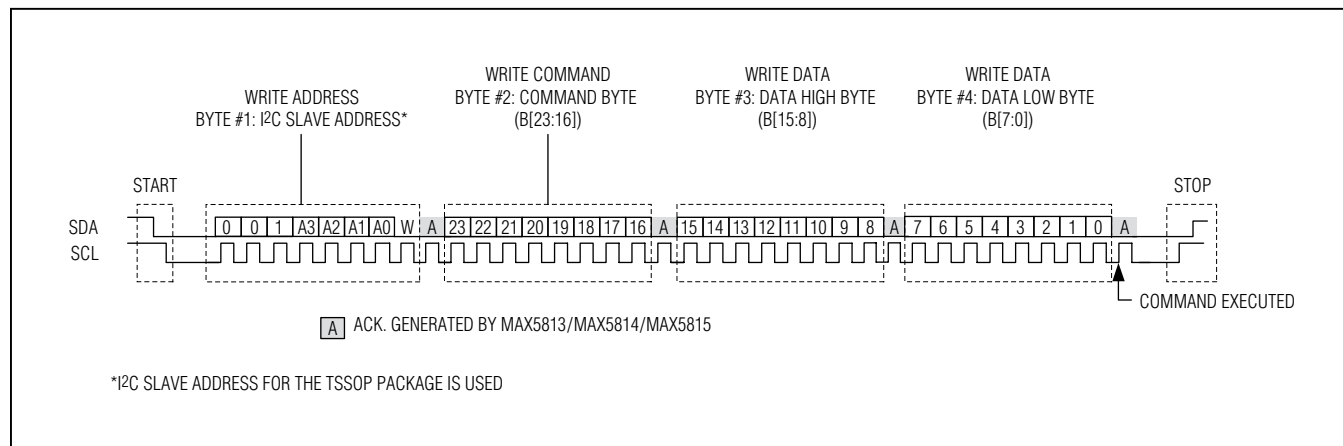

Figure 4. I²C Single Register Write Sequence
Figure 5. Multiple Register Write Sequence (Standard I2C Protocol)
Figure 6. Standard I2C Register Read Sequence

Combined Format I2C Readback Operations

Each readback sequence is framed by a START or Repeated START condition and a STOP condition. Each word is 8 bits long and is followed by an acknowledge clock pulse as shown in Figure 6. The first byte contains the address of the MAX5813/MAX5814/MAX5815 with $R/\overline{W} = 0$ to indicate a write. The second byte contains the register that is to be read back. There is a Repeated START condition, followed by the device address with $R/\overline{W} = 1$ to indicate a read and an acknowledge clock. The master has control of the SCL line but the MAX5813/MAX5814/MAX5815 take over the SDA line. The final two bytes in the frame contain the register data readback followed by a STOP condition. If additional bytes beyond those required to readback the requested data are provided, the MAX5813/MAX5814/MAX5815 will continue to readback ones.

Readback of individual CODE registers is supported for the CODE command (B[23:20] = 0000). For this command, which supports a DAC address, the requested channel CODE register content will be returned; if all DACs are selected, CODEA content will be returned.

Readback of individual DAC registers is supported for all LOAD commands (B[23:20] = 0001, 0010, or 0011). For these commands, which support a DAC address, the requested DAC register content will be returned. If all DACs are selected, DACA content will be returned.

Modified readback of the POWER register is supported for the POWER command (B[23:20] = 0100). The power status of each DAC is reported in locations B[3:0], with a 1 indicating the DAC is powered down and a 0 indicating the DAC is operational (see Table 3).

Ultra-Small, Quad-Channel, 8-/10-/12-Bit Buffered Output DACs with Internal Reference and I²C Interface

Readback of all other registers is not directly supported. All requests to read unsupported registers reads back the device's reference status and the device ID and revision information in the format as shown in Table 3.

Interface Verification I²C Readback Operations

While the MAX5813/MAX5814/MAX5815 support standard I²C readback of selected registers, it is also capable of functioning in an interface verification mode. This mode is accessed any time a readback operation follows an executed write mode command. In this mode, the last executed three-byte command is read back in its entirety. This behavior allows verification of the interface.

Sample command sequences are shown in Figure 7. The first command transfer is given in write mode with R/$\overline{W}$ = 0 and must be run to completion to qualify for interface verification readback. There is now a STOP/START pair or Repeated START condition required, followed by the readback transfer with R/$\overline{W}$ = 1 to indicate a read and an acknowledge clock from the MAX5813/

MAX5814/MAX5815. The master still has control of the SCL line but the MAX5813/MAX5814/MAX5815 take over the SDA line. The final three bytes in the frame contain the command and register data written in the first transfer presented for readback, followed by a STOP condition. If additional bytes beyond those required to read back the requested data are provided, the MAX5813/MAX5814/MAX5815 will continue to read back ones.

It is not necessary for the write and read mode transfers to occur immediately in sequence. I²C transfers involving other devices do not impact the MAX5813/MAX5814/MAX5815 readback mode. Toggling between readback modes is based on the length of the preceding write mode transfer. Combined format I²C readback operation is resumed if a write command greater than two bytes but less than four bytes is supplied. For commands written using multiple register write sequences, only the last command executed is read back. For each command written, the readback sequence can only be completed one time; partial and/or multiple attempts to readback executed in succession will not yield usable data.

I²C Compatibility

The MAX5813/MAX5814/MAX5815 are fully compatible with existing I²C systems. SCL and SDA are high-impedance inputs; SDA has an open drain which pulls the data line low to transmit data or ACK pulses. Figure 8 shows a typical I²C application.

I²C User-Command Register Map

This section lists the user accessible commands and registers for the MAX5813/MAX5814/MAX5815.

Table 5 provides detailed information about the Command Registers.

CODEn Command

The CODEn command (B[23:20] = 0000) updates the CODE register contents for the selected DAC(s). Changes to the CODE register content based on this command will not affect DAC outputs directly unless the $\overline{LDAC}$ is in a low state or the DAC latch has been configured to be transparent. Issuing the CODEn command with DAC SELECTION = ALL DACs is equivalent to CODE_ALL (B[23:16] = 10000000). See Table 5 and Table 6.

LOADn Command

The LOADn command (B[23:20] = 0001) updates the DAC register content for the selected DAC(s) by uploading the current contents of the CODE register. The LOADn command can be used with DAC SELECTION = ALL DACs to issue a software load for all DACs, which is equivalent to the LOAD_ALL (B[23:16] = 10000001) command. See Table 5 and Table 6.

CODEn_LOAD_ALL Command

The CODEn_LOAD_ALL command (B[23:20] = 0010) updates the CODE register contents for the selected DAC(s) as well as the DAC register content of all DACs. Channels for which the CODE register content has not been modified since the last load to DAC register or $\overline{LDAC}$ operation will not be updated to reduce digital crosstalk. Issuing this command with DAC_ADDRESS = ALL is equivalent to the CODE_ALL_LOAD_ALL command. The CODEn_LOAD_ALL command by definition will modify at least one CODE register. To avoid this, use the LOADn command with DAC SELECTION = ALL DACs or use the LOAD_ALL command. See Table 5 and Table 6.

CODEn_LOADn Command

The CODEn_LOADn command (B[23:20] = 0011) updates the CODE register contents for the selected DAC(s) as well as the DAC register content of the selected DAC(s). Channels for which the CODE register content has not been modified since the last load to DAC register or $\overline{LDAC}$ operation will not be updated to reduce digital crosstalk. Issuing this command with DAC SELECTION = ALL DACs is equivalent to the CODE_ALL_LOAD_ALL command. See Table 5 and Table 6.

CODE_ALL Command

The CODE_ALL command (B[23:16] = 10000000) updates the CODE register contents for all DACs. See Table 5.

LOAD_ALL Command

The LOAD_ALL command (B[23:16] = 10000001) updates the DAC register content for all DACs by uploading the current contents of the CODE registers. See Table 5.

CODE_ALL_LOAD_ALL Command

The CODE_ALL_LOAD_ALL command (B[23:16] = 1000001x) updates the CODE register contents for all DACs as well as the DAC register content of all DACs. See Table 5.

Table 5. I2C Commands Summary

Reserved Commands: Any commands not specifically listed above are reserved for Maxim internal use only.

Ultra-Small, Quad-Channel, 8-/10-/12-Bit Buffered Output DACs with Internal Reference and I²C Interface

Table 6. DAC Selection

B19	B18	B17	B16	DAC SELECTED
0	0	0	0	DAC A
0	0	0	1	DAC B
0	0	1	0	DAC C
0	0	1	1	DAC D
X	1	X	X	ALL DACs
1	X	X	X	ALL DACs

POWER Command

The MAX5813/MAX5814/MAX5815 feature a software-controlled power-mode (POWER) command (B[23:20] = 0100). The POWER command updates the power-mode settings of the selected DACs while the power settings of the rest of the DACs remain unchanged. The new power setting is determined by bits B[17:16] while the affected DAC(s) are selected by bits B[11:8]. If all DACs are powered down, the device enters a STANDBY mode.

In power-down, the DAC output is disconnected from the buffer and is grounded with either one of the two selectable internal resistors or set to high impedance. See Table 8 for the selectable internal resistor values in power-down mode. In power-down mode, the DAC register retains its value so that the output is restored when the device powers up. The serial interface remains active in power-down mode.

In STANDBY mode, the internal reference can be powered down or it can be set to remain powered-on for external use. Also, in STANDBY mode, devices using the external reference do not load the REF pin. See Table 7.

SW_RESET and SW_CLEAR Command

The SW_RESET (B[23:16] = 01010001) and SW_CLEAR (B[23:16] = 01010000) commands provide a means of issuing a software reset or software clear operation. Use SW_CLEAR to issue a software clear operation to return all CODE and DAC registers to the zero-scale value. Use SW_RESET to reset all CODE, DAC, and configuration registers to their default values.

Table 7. POWER (100) Command Format

B23	B22	B21	B20	B19	B18	B17	B16	B15	B14	B13	B12	B11	B10	B9	B8	B7	B6	B5	B4	B3	B2	B1	B0
0	1	0	0	0	0	PD1	PD0	X	X	X	X	D	C	B	A	X	X	X	X	X	X	X	X
POWER Command						Power Mode: 00 = Normal 01 = 1kΩ 10 = 100kΩ 11 = Hi-Z		Don't Care				DAC Select: 1 = DAC Selected 0 = DAC Not Selected				Don't Care							
Default Values (all DACs) ⊠						0	0	X	X	X	X	1	1	1	1	X	X	X	X	X	X	X	X

Table 8. Selectable DAC Output Impedance in Power-Down Mode

PD1 (B17)	PD0 (B16)	OPERATING MODE
0	0	Normal operation
0	1	Power-down with internal 1kΩ pulldown resistor to GND.
1	0	Power-down with internal 100kΩ pulldown resistor to GND.
1	1	Power-down with high-impedance output.

Ultra-Small, Quad-Channel, 8-/10-/12-Bit Buffered Output DACs with Internal Reference and I^{2}C Interface

CONFIG Command

The CONFIG command (B[23:20] = 0110) updates the $\overline{\text{LDAC}}$ and LOAD functions of selected DACs. Issue the command with B16 = 0 to allow the DAC latches to operate normally or with B16 = 1 to disable the DAC latches, making them perpetually transparent. Mode settings of the selected DACs are updated while the mode settings of the rest of the DACs remain unchanged; DAC(s) are selected by bits B[11:8]. See Table 9.

REF Command

The REF command updates the global reference setting used for all DAC channels. Set B[17:16] = 00 to use an external reference for the DACs or set B[17:16] to 01, 10, or 11 to select either the 2.5V, 2.048V, or 4.096V internal reference, respectively.

If RF2 (B18) is set to zero (default) in the REF command, the reference will be powered down any time all DAC channels are powered down (in STANDBY mode). If RF2 (B18 = 1) is set to one, the reference will remain powered even if all DAC channels are powered down, allowing continued operation of external circuitry. In this mode, the 1µA shutdown state is not available. See Table 10.
