

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

General Description

The MAX8600/MAX8601 single-/dual-input linear battery chargers safely charge single-cell Li+ batteries. The charging rate is optimized to accommodate the thermal characteristics of a given application. There is no need to reduce the maximum charge current or worst-case charger power dissipation. Charging is optimized for Li+ cells using a control algorithm that includes low-battery precharging, voltage and currentlimited fast-charging, and top-off charging, while continuously monitoring the battery for overvoltage, over/undertemperature, and charging time. The charger timeout protection is programmable. The charger status is indicated by three open-drain outputs.

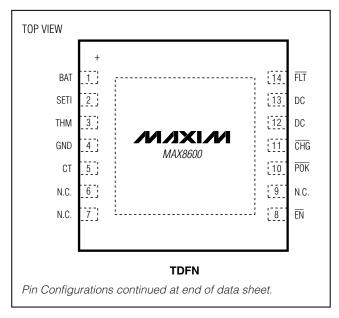

The MAX8601 automatically selects between either a USB or AC adapter input source. The AC adapter charge current is programmable, while USB charge current is set not to exceed either 100mA or 500mA. depending on the USEL input. The MAX8600 is a single-input charger with no USB source input.

The MAX8600/MAX8601 are available in a 3mm x 3mm power-enhanced TDFN package.

Applications

Cell Phones	Portable Media Player
Digital Cameras	MP3 Players
PDAs	Wireless Appliances

Pin Configurations

Features

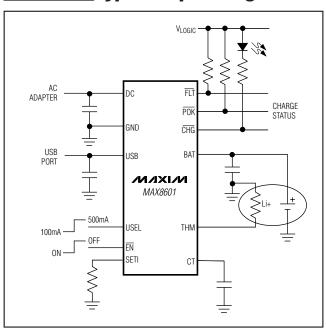

- ♦ Single- (MAX8600) or Dual- (MAX8601) Input Li+ Charger
- ♦ Up to 1A Programmable Fast-Charge
- ♦ 100mA/500mA USB Select Input (MAX8601)
- **♦** ±5% Fast-Charge Current-Limit Accuracy
- **♦ 14V Input Overvoltage Protection**
- ♦ Programmable On-Chip Charge Timers
- ♦ Battery Thermistor Input
- **♦ Charger-Status Outputs**
- ♦ Thermally Optimized Charge Rate
- ◆ 14-Pin, 3mm x 3mm TDFN Package

Pin Description

Р	'IN	NAME	FUNCTION
MAX8600	MAX8601	NAME	FUNCTION
1	1, 7	ВАТ	Battery Connection. The IC delivers charging current and monitors battery voltage using BAT. Bypass BAT to GND with a 2.2µF or larger ceramic capacitor. Connect both BAT inputs together externally (MAX8601). BAT is high impedance when the IC is disabled.
2	2	SETI	DC Charge-Current Programming Input. Connect a resistor from SETI to GND to set the maximum charging current when using the DC input, the prequal current from either input, and the CHG turn-off threshold.
3	3	ТНМ	Thermistor Input. Connect a $10k\Omega$ NTC thermistor, in close proximity to the battery, from THM to ground to monitor the battery temperature. Connect THM to GND to disable the thermistor functionality. The IC suspends charging when R_{THM} is outside the hot and cold limits.
4	4	GND	Ground
5	5	СТ	Timing Capacitor Input. Connect a capacitor from CT to GND to set the precharge timeout, top-off time, and fast-charge timeout. Connect CT to GND to disable the timers.
6, 7, 9	_	N.C.	No Connection. Make no external circuit connection.
8	8	ĒN	Active-Low Enable Input. Drive low or connect \overline{EN} to GND to enable the charger. Drive \overline{EN} high to disable the charger.
10	10	POK	Power-OK Monitor. \overline{POK} is an open-drain output that pulls low when a valid charging source is detected at either DC or USB (MAX8601). \overline{POK} is high impedance when \overline{EN} is high.
11	11	CHG	Charging-Status Output. CHG goes low when the battery is above 3V and being charged with a current greater than 7.5% of the current programmed with R _{SETI} . CHG is high impedance when the charger is in prequal, top-off, or disabled.

Pin Description (continued)

Р	IN	NAME	FUNCTION
MAX8600	MAX8601	INAIVIE	FUNCTION
12, 13	12, 13	DC	DC Input Supply. Connect DC to a 4.5V to 7V charging source. Bypass DC to GND with a 1µF or larger capacitor. DC takes priority over USB when both are present (MAX8601). Both DC inputs should be connected together externally.
14	14	FLT	Fault Status Output. FLT goes low when either the prequal timer or the fast-charge timers expire and the battery voltage is not above the required threshold. Clear the fault by raising EN or removing input power.
_	9	USB	USB Input Source. Connect to a USB port. Bypass USB to GND with a 1µF or larger capacitor.
_	6	USEL	USB Charge-Select Input. Logic input that determines the maximum charge current drawn from the USB input. IBAT = 95mA when USEL = low, and IBAT = 475mA when USEL = high.
_	_	EP	Exposed Pad. Connect to the GND plane for optimum thermal dissipation.

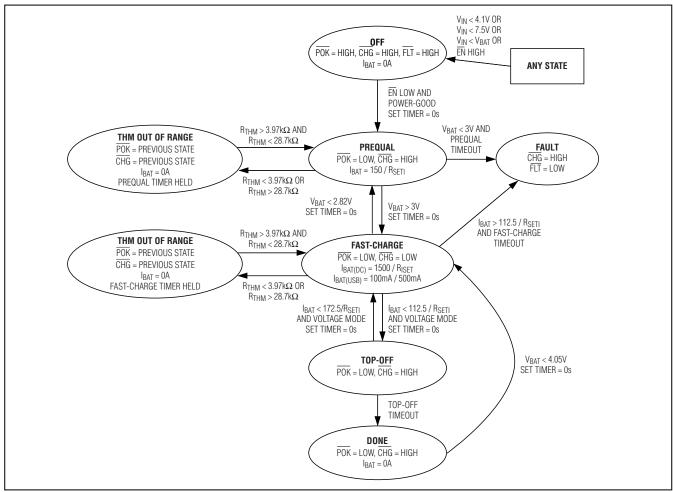

Figure 1. Charger State Diagram

_Detailed Description

DC Charging

The MAX8600/MAX8601 are designed to charge a single-cell Li+ battery from a DC source voltage between 4.15V and 7V. The precharge current, charge current, and top-off threshold are programmable with RSETI.

USB Charging (MAX8601)

The MAX8601 contains a USB input that allows operation from either a DC source or a USB port. A USEL input allows the user to select either a 100mA or 500mA maximum charging current when using the USB input. If both VUSB and VDC are valid, the MAX8601 operates from DC. If VDC is invalid (undervoltage/overvoltage), the MAX8601 operates from USB. When charging at 100mA from the USB input, the fast-charge timer is inhibited.

EN Charger-Enable Input

EN is a logic input (active low) that enables the charger. Drive EN high to disable the charger-control circuitry. Drive EN low or connect to GND for normal operation.

Soft-Start

To prevent input transients, the rate of change of charging current is limited. When the charger is turned on or when the input source is changed, charge current is ramped from 0 to the set current value in typically 1.2ms. This also means that if charging is taking place from USB, and the DC input is then powered, charge current falls to zero and then is reramped to the DC charge rate. This is done to ensure that the DC source is not subjected to a severe load current step.

Charge-current ramp up is also limited when transitioning from prequal to fast-charge, and when changing the USB charge current from 100mA to 500mA with USEL. There is no di/dt limiting, however, if ISET is changed suddenly using a switch at RSETI.

Thermal-Limit Control

The MAX8600/MAX8601 feature a thermal limit that reduces the charge current when the die temperature exceeds +100°C. As the temperature increases above +100°C, the IC lowers the charge current by 5%/°C.

CHG Charge-Indicator Output

CHG is an open-drain output that indicates charger status. $\overline{\text{CHG}}$ goes low during charge cycles where V_{BAT} is greater than 3V and I_{BAT} is greater than 7.5% of the maximum charge current set by R_{SETI}. When the MAX8600/MAX8601 are used in conjunction with a microprocessor (μ P), connect a pullup resistor between CHG and the logic I/O voltage to indicate charge status to the μ P. Alternatively, CHG can sink up to 20mA for an LED charge indicator.

Fault Indicator (FLT)

The MAX8600/MAX8601 contain an open-drain FLT output to signal the user when a fault occurs. FLT goes low if the charger is in prequal and the prequal timer expires, or if the charger is in fast-charge and the fast-charge time expires. FLT does NOT go low if the THM thermistor temperature is out of range. Toggle EN or the input power to reset the FLT indicator.

Power-OK Indicator (POK)

The MAX8600/MAX8601 contain an open-drain POK output that goes low when a valid input source is detected at DC or USB (MAX8601 only). A valid input source is one whose voltage is between 4.15V and 7V and exceeds the battery voltage by 320mV. After a valid input has been established, charging is sustained with inputs as low as 3.5V as long as the input voltage remains above the battery voltage by at least 55mV (typ). POK is high impedance when the charger is disabled.

Applications Information

Figure 2 shows the typical operating circuit for the MAX8601. The following section describes component changes for different charging current and timer durations.

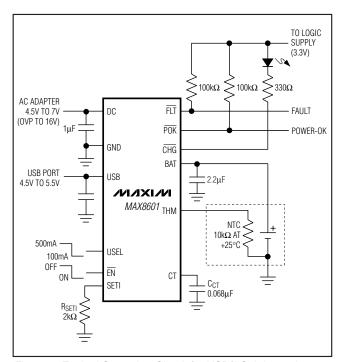

Figure 2. Typical Operating Circuit for USB/AC-Adapter Input Charger. An R_{SETI} of $2k\Omega$ sets an AC adapter fast-charge of 750mA.

Table 1. Fault Temperatures for Different Thermistors

THERMISTOR BETA	3000	3250	3500	3750
Resistance at +25°C	10,000Ω	10,000Ω	$10,000\Omega$	$10,000\Omega$
Resistance at +50°C	4587.78Ω	4299.35 $Ω$	4029.06Ω	3775.75Ω
Resistance at 0°C	25,140.55Ω	$27,148.09\Omega$	$29,315.94\Omega$	$31,656.90\Omega$
Nominal Hot Trip Temperature	+55.14°C	+52.60°C	+50.46°C	+48.63°C
Nominal Cold Trip Temperature	-3.24°C	-1.26°C	+0.46°C	+1.97°C

Charge Current Selection

The maximum charging current from a supply connected to DC is programmed by an external resistor (RSETI) connected from SETI to GND. Calculate the RSETI value as follows:

where I_{CHARGE(MAX)} is in amps and R_{SETI} is in ohms. SETI can also be used to monitor the actual charge-current level. The output voltage at SETI is proportional to the charging current as follows:

Note that the prequal current for both USB and DC input operation is 1/10 of the fast-charge current set by RSETI. Also, the top-off charge-current threshold for both USB and DC input operation is set to 7.5% of the fast-charge current set by RSETI.

Timer Capacitor Selection

The MAX8600/MAX8601 contain timers for prequal, fast-charge, and top-off operation. These time periods are determined by the capacitance from CT to GND. To set the charge times, calculate CCT as follows:

Note that when charging at 100mA from the USB input (MAX8601), the fast-charge timer is inhibited. When THM halts charging, the timers stop and hold their value.

Battery Temperature Control

The MAX8600/MAX8601 monitor battery temperature through a negative TC thermistor which is in close thermal contact with the battery. Select a thermistor resistance that is $10k\Omega$ at $+25^{\circ}$ C and has a beta of 3500. The IC compares the resistance from THM to GND and suspends charging when it is greater than $28.3k\Omega$ or

less than $3.94 k\Omega$, which translates to a temperature of 0°C to +50°C. Table 1 shows the nominal temperature limits that result from a wide range of available thermistor temperature curves. The curves are defined by the following equation:

$$R_T = R_{25^{\circ}C \times e} \left\{ \beta \left[\left(\frac{1}{T + 273} \right) - \left(\frac{1}{298} \right) \right] \right\}$$

where β is the BETA term in Table 1.

Connect THM to GND to disable the temperature-control function. When R_{THM} disables charging, all timers pause and hold their value.

Capacitor Selection

Connect a 2.2 μ F ceramic capacitor from BAT to GND for proper stability. Connect a 1 μ F ceramic capacitor from DC to GND. If using the USB input for the MAX8601, bypass USB to GND with a 1 μ F ceramic capacitor. Use a larger input bypass capacitor for high charging currents to reduce supply noise. All capacitors should be X5R dielectric or better. Be aware that some capacitors have large voltage coefficients and should be avoided.

Thermal Considerations

The MAX8600/MAX8601 are in a thermally enhanced TDFN package with an exposed paddle. Connect the exposed paddle of the package to a large copper ground plane to provide a thermal contact between the device and the circuit board. The exposed paddle transfers heat away from the device, allowing the IC to charge the battery with maximum current, while minimizing the increase in die temperature. Note that the MAX8600/MAX8601s' thermal-limit control allows the charger to be tolerant of thermally restricted PC board layouts that are sometimes unavoidable in compact portable designs. With such non-optimal layouts, the charger still operates, but may reduce charge current to manage temperature rise.

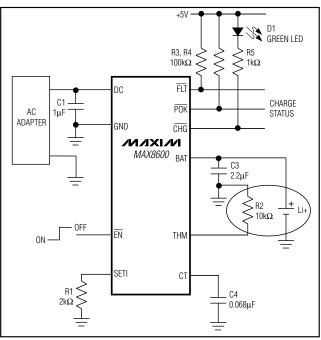

Figure 3. Stand-Alone Li+ Battery-Charger with the MAX8600

DC Input Sources

The MAX8600/MAX8601 operating input voltage range is 4.15V to 7V. The device survives input voltages up to 16V without damage to the IC. If the input voltage is greater than 7.5V (typ), the IC stops charging. An appropriate power supply must provide at least 4.2V plus the voltage drop across the internal pass transistor when sourcing the desired maximum charging current.

where R_{ON} is the input-to-BAT resistance (typically 0.5 Ω). Failure to meet this requirement results in an incomplete charge or increased charge time.

Stand-Alone Li+ Charger

The MAX8600 provides a complete Li+ charging solution. Figure 3 shows the MAX8600 as a stand-alone Li+ battery charger. The $2k\Omega$ resistor connected to SETI sets a charging current of 750mA. The LED indicates when fast-charge has begun. When fast-charge is complete, the LED turns off.

USB-Powered Li+ Charger (MAX8601)

The universal serial bus (USB) provides a high-speed serial communication port as well as power for the

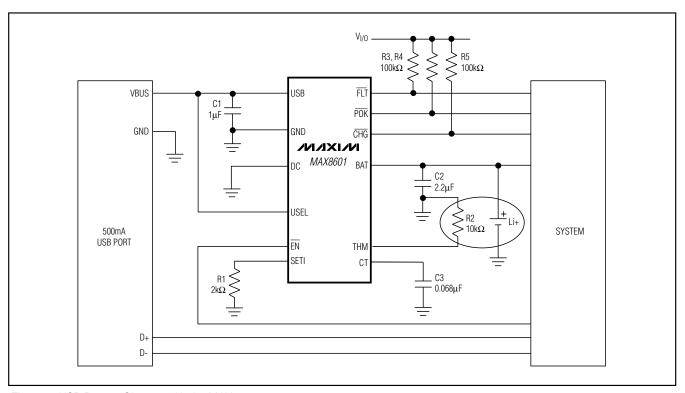

Figure 4. USB Battery Charger with the MAX8601

remote device. The MAX8601 can be configured to charge its battery at the highest current possible from the host port. Figure 4 shows the MAX8601 configured as a USB battery charger. A USEL input sets the maximum charging current from the USB input at 100mA or 500mA.

Layout and Bypassing

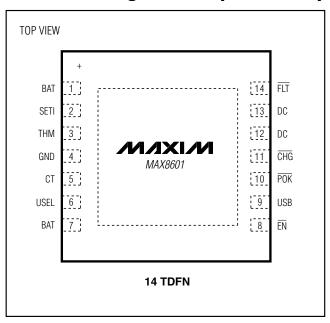

Connect the input capacitors as close to the device as possible. Provide a large copper GND plane to allow the exposed paddle to sink heat away from the device. Connect the battery to BAT as close to the IC as possible to provide accurate battery voltage sensing. Make all high-current traces short and wide to minimize voltage drops. For an example layout, refer to the MAX8601 evaluation kit.
