

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

## General Description

The MAX86150 evaluation kit (MAX86150EVSYS#) provides a proven platform to evaluate the MAX86150 integrated photoplethysmogram (PPG) and Electrocardiogram (ECG) sensor module. The EV kit consists of two parts, a MAX86150EVKIT (Bluetooth Low-Energy (BLE) device) and an android tablet with application software pre-installed.

The MAX86150EVKIT BLE device consists of a board that includes the MAX86150 together with 2 stainless steel dry electrodes for ECG evaluation purposes. The EV kit is powered by a single external coin battery (CR2032), as well as +1.8V and +3.3V voltage regulators for the sensor ASIC and the internal LEDs of the MAX86150, respectively.

The EV kit comes with a MAX86150EFN+ in a 22-pin OLGA (Organic Land Grid Array) package.

## Features

- Real-Time Monitoring of Optical Reflective PPG and 1 Lead ECG
- Data-Logging Capabilities
- Fully Assembled and Tested
- Integrated and Exchangeable Dry Electrodes

*[Ordering Information](#) appears at end of data sheet.*

## Quick Start

### Required Equipment

- MAX86150EVKIT (BLE device)
- 1 x CR2032 lithium coin 3V battery (included)
- Android tablet (included)

### Procedure

The EV kit ([Figure 1](#)) is fully assembled and tested. Follow the steps below to verify board operation:

- 1) Turning on the device. Please refer to [Figure 2](#) for details.
  - a. Slide the black slider switch to on. The system will go into low power sleep mode after 1-2 min of inactivity. If on, but asleep, press the “wake-up” push-button (located below and to the left of module).
  - b. Once on, you should see a blue BLE pairing light. If no light is present, check connections or try replacing the CR2032 Li Battery with a fresh one.
- 2) The included tablet comes with the APK software pre-installed.
- 3) Make sure bluetooth is enabled on the tablet provided. **Do not upgrade the preinstalled Android operating system.**
- 4) Open the “**Sensor MAX86150 EV**” Application by clicking the teal Maxim logo ([Figure 3](#)).
- 5) The splash page will first appear as in [Figure 4](#).
- 6) Then, you will need to connect to the BLE EV KIT Hardware. Do this by selecting the “Maxim BT 2.0” that shows up upon opening the android application ([Figure 5](#)).

**Note:** “Maxim BT #.##” may be vary depending on the firmware version.

**Note:** The blue LED will stay on until you either swipe left or press the “ECG+PPG” tab at the top.

- 7) After a bluetooth connection is successfully established, the main GUI will launch, as shown in [Figure 6](#).
- 8) Each of the highlighted blocks on the sensor functional block diagram are programmable. Refer to [Detailed Description of GUI](#) for more information.
- 9) Once you have selected the desired settings, swipe **left** or press **“ECG+PPG”** at the top to start PPG+ECG data acquisitions.
- 10) Please refer to [ECG Usage](#) for more details on finger placement.

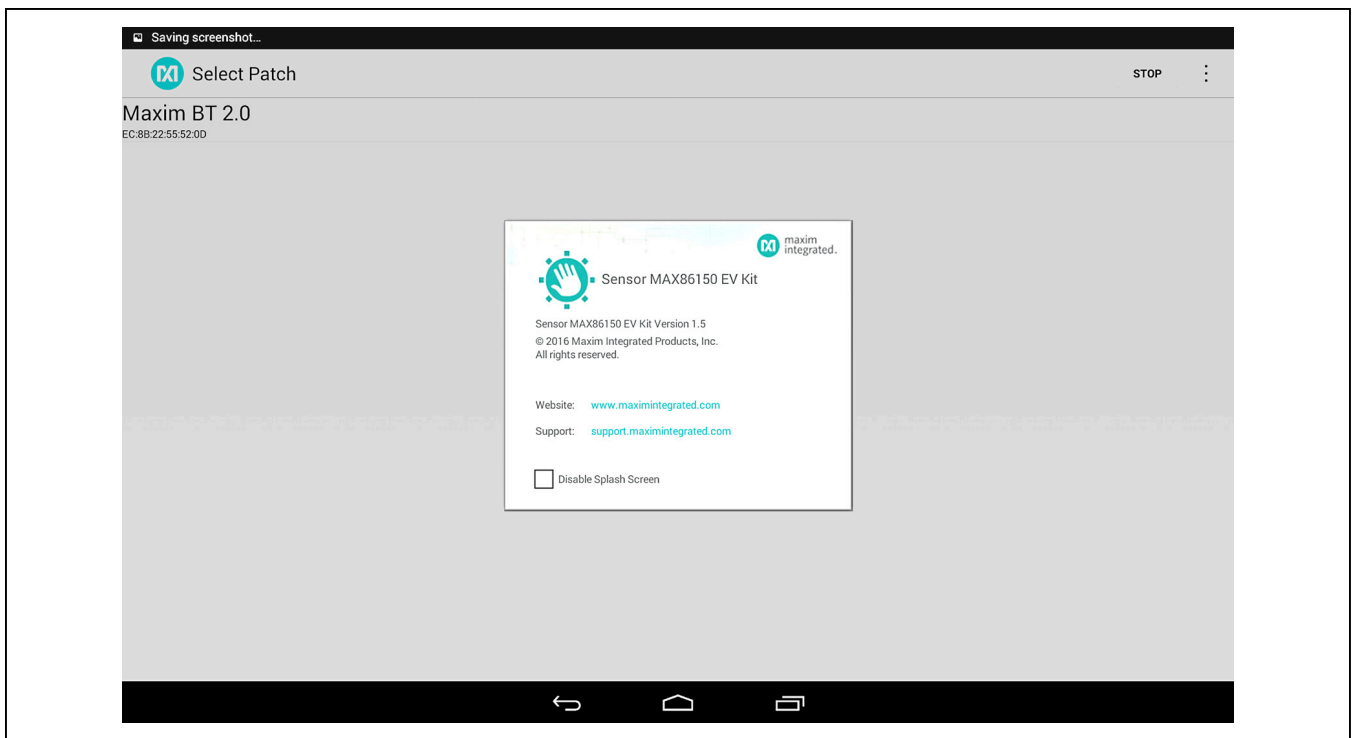

Figure 4. MAX86150 EVKIT Application Splash Screen

Figure 5. Bluetooth Pairing Interface

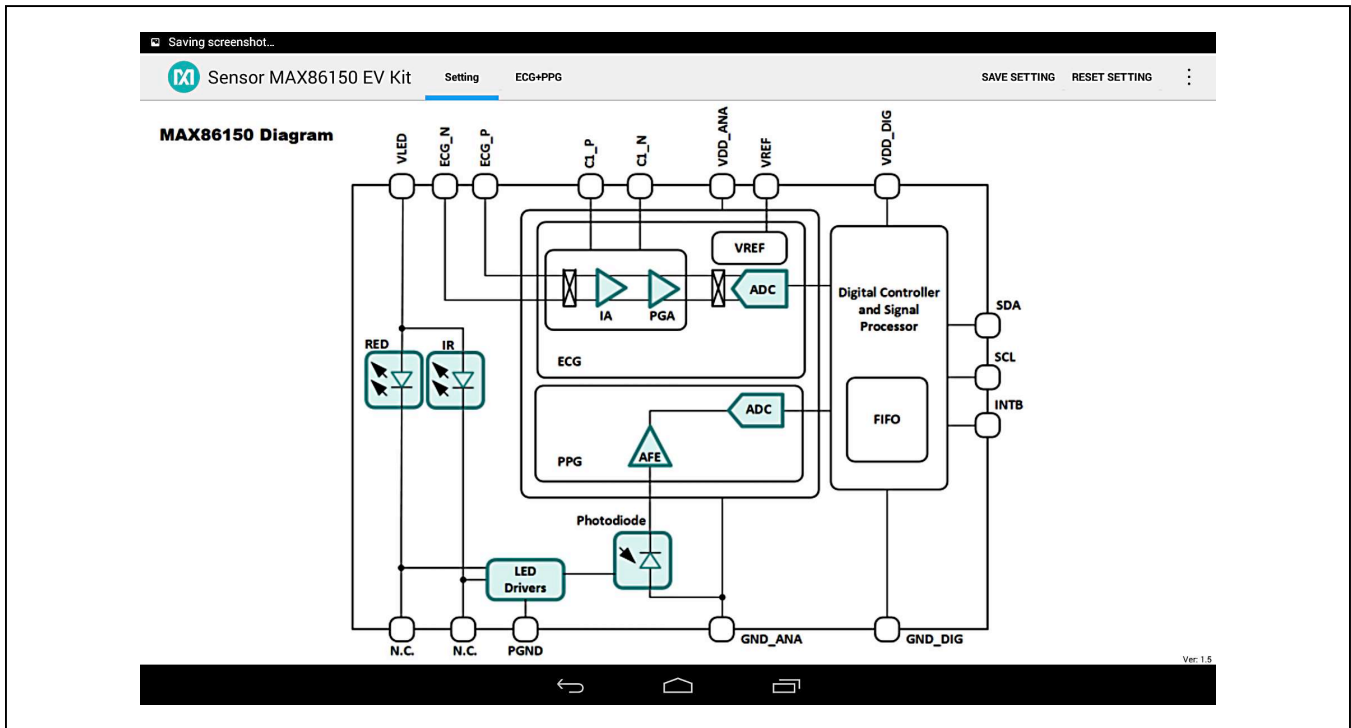

Figure 6. MAX86150 Block Diagram and Configuration Menu

Figure 7. MAX86150 EV Kit ECG and PPG Waveform Display

### Detailed Description of GUI

The MAX86150 EV kit applications consist of two main tabs: Setting and ECG+PPG.

#### Setting Tab

Under the Setting Tab, users have full access to the sensor configurations. With the MAX86150 sensor data sheet handy, select the desired settings by clicking on the **turquoise-colored** components. Please allow a few seconds for the BLE handshake to occur before navigating the configuration menus.

#### PPG Settings

##### LED Drivers

By selecting the “LED drivers” button, one can select the maximum LED current range for both Red and IR LED, respectively. After pressing the button, the pop-up menu (shown in Figure 8) will appear. Select the respective LED range you would like to change and press the button. If IR LED Drivers is chosen, the pop-up menu shown in Figure 9 will appear. Each LED driver consists of four different ranges that can be selected from IR LED Range/Red LED Range.

- 50mA: 0mA–51mA (0.2mA/LSB)
- 100mA: 0mA–102mA (0.4mA/LSB)

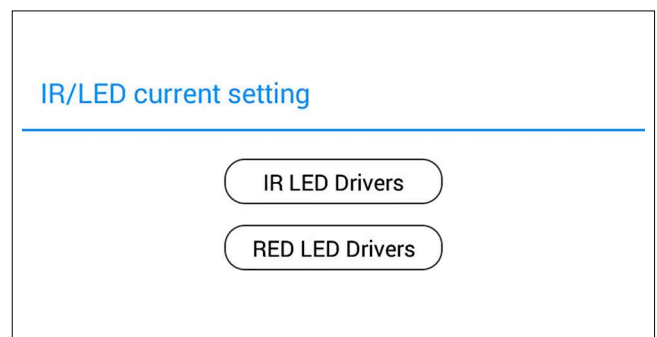

Figure 8. IR/LED current setting

Figure 9. IR LED Drivers (LED Current Range)

**RED and IR LED Current**

After selecting the maximum LED current range, the drive current of both Red and IR LED can be adjusted individually. If the “Red” button is clicked, the pop-up menu in [Figure 10](#) will appear. To adjust the Red LED current, move the slider left or right to adjust the required LED current levels, and press OK.

**PPG Configurations**

There are three PPG configurations, accessible by selecting either “AFE” or “ADC” under the PPG Block. The following options will be presented ([Figure 11](#)).

- PPG\_ADC\_RGE - PPG ADC Full Range
- PPG\_SR - PPG Sample Rate
- PPG\_SMP\_AVG - PPG Sample Average

**PPG\_ADC\_RGE**

The **ADC FULL Range** is adjustable from 4096 to 32768nA, as shown in [Figure 12](#).

**PPG\_SR**

The **Sample Rate** drop-down menu is adjustable from 10Hz to 3200Hz, as shown in [Figure 13](#). If the selected sample rate is not supported with the selected pulse width and LED mode, then the highest available sample rate will be automatically set. The user can read back this register to confirm the sample rate. Refer to the MAX86150 data sheet for more details.

**Note:** The BLE bandwidth cannot support large bandwidth transmissions; samples may be dropped when changing the sample rates and/or sample averaging settings. Supported/default sample rate settings are 200Hz ECG, 100Hz PPG (100Hz Red, 100Hz IR). This is a Bluetooth LE limitation, not a device limitation.

**PPG\_SMP\_AVG**

To reduce the amount of data throughput, adjacent samples (in each individual channel) can be averaged and decimated on the chip by setting this register. These bits set the number of samples that are averaged on-chip before being written to the FIFO.

The **Sample Averaging** drop-down menu is adjustable from 1 to 32, as shown in [Figure 14](#).

Figure 10. RED LED Current

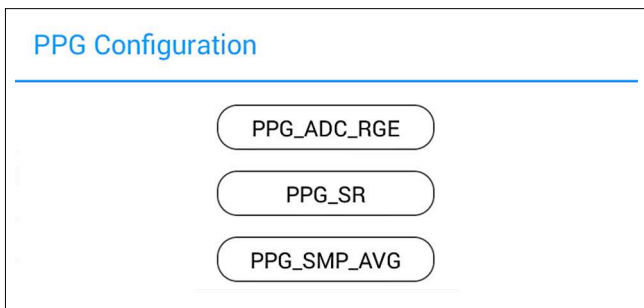

Figure 11. PPG Configuration

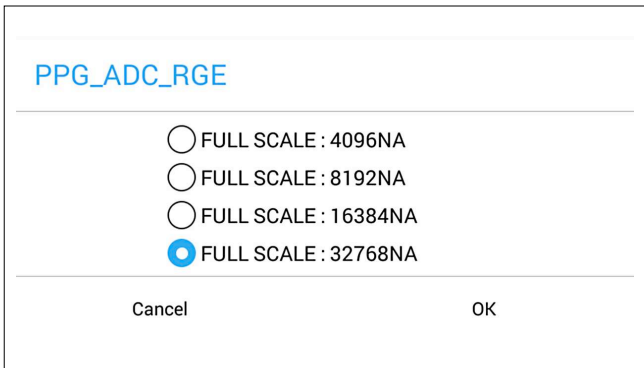

Figure 12. PPG ADC Full Range

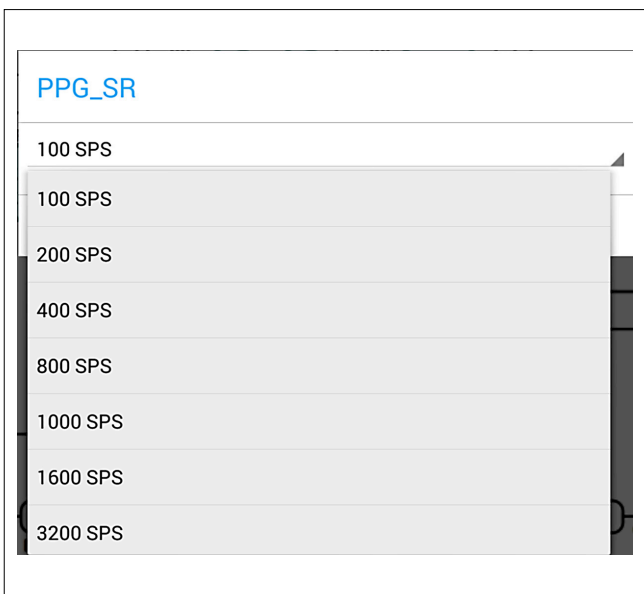

Figure 13. PPG Sample Rate

### PPG\_LED\_PW

The pulse width of the LED drivers, and the integration time of PPG ADC, can be adjusted by pressing “Photodiode” in the block diagram. The **Pulse Width** list is adjustable from 50µs to 400µs, as shown in [Figure 15](#). The maximum supported sample rates are also determined by the pulse widths and number of LEDs used. Refer to the MAX86150 data sheet for details.

## ECG Configurations

### ECG Sample Rate

By selecting “ADC” under the ECG block, the ECG sample rate can be set as shown in [Figure 16](#). These bits set the oversampling ratio (OSR) of the ECG ADC. **ECG\_ADC\_OSR<1:0>** together with the ADC clock frequency and (**ECG\_ADC\_CLK[2]**) set the ECG sample rate. Refer to the MAX86150 data sheet for the filter bandwidth of each option.

**Note:** *The BLE bandwidth cannot support large bandwidth transmissions; samples may be dropped when changing the sample rates and/or sample averaging settings. Supported/default sample rate settings are 200Hz ECG, 100Hz PPG (100Hz Red, 100Hz IR). This is a Bluetooth LE limitation, not a device limitation.*

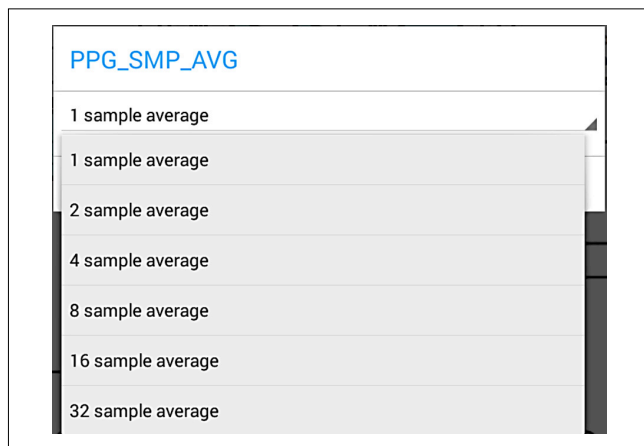

Figure 14. PPG Sample Averaging

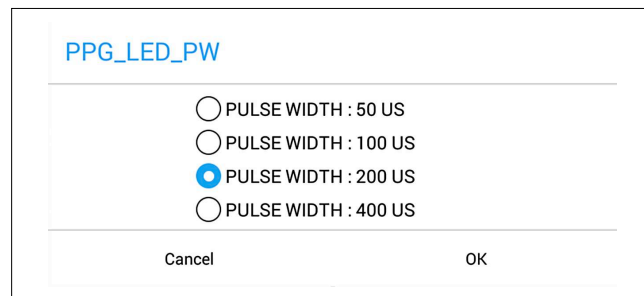

Figure 15. PPG LED Pulse Width

### ECG PGA Gain

ECG PGA Gain options can be set by selecting “PGA” under the ECG block, as shown in [Figure 17](#). The **ECG PGA Gain** drop-down list is adjustable from 1 to 8V/V.

### ECG IA Gain

ECG Instrumentation Amplifier Gain options can be set by selecting “IA” under the ECG block, as shown in [Figure 18](#). The **ECG IA Gain** drop-down list is adjustable from 5 to 50V/V.

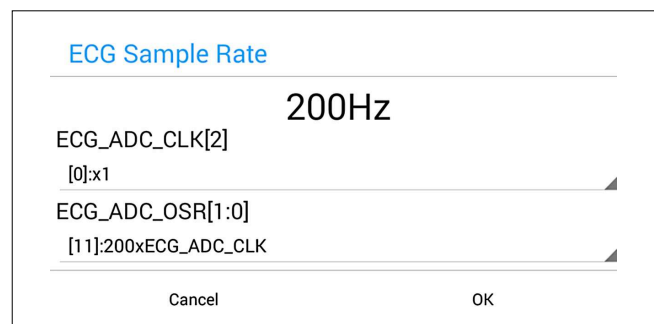

Figure 16. ECG Sample Rate

Figure 17. ECG PGA Gain

Figure 18. ECG IA Gain

## Menu Buttons

### RESET Setting and SAVE Setting

In order to reset the register settings to the EV kit's default settings, press "RESET SETTING" in the upper-right-hand corner.

The default register settings are

- ECG\_SR – 200Hz
- PPG\_SR – 100Hz
- LED currents (Red and IR) – 17mA
- ADC Full-Scale Current – 32768 $\mu$ A
- LED Pulse Width – 200 $\mu$ S
- ECG Gain –  $9.5 \times 8 = 76V/V$
- ECG\_ADC\_CLK = 1

Additionally, you can save your current configuration to a file for later retrieval. The files are located in the tablet's main directory, entitled "ekgppg\_setting\_DATE\_TIME.txt".

### Data Logging

To save logging data, click "START LOG" in the upper-right-hand corner of the ECG+PPG screen that displays the waveforms. This will log and timestamp Red LED, IR LED, Filtered ECG, Raw ECG, HR (BPM), SpO2, HRV (Heart Rate Variability), RR (Respiration Rate), and other information into a csv file located in the tablet's main directory, entitled "ecgppg\_DATE\_TIME.csv".

## Detailed Description of Hardware and Usage

### Turning on the Device

Slide the black switch on the battery compartment to ON. The system will go into low-power sleep mode after 1-2 minutes of inactivity. If on, but asleep, press "wake-up" push-button (SW2 – located below and to the left of module).

Once it's turned on, you should see a blue light (LD1). If no light is present, check connections or try replacing the CR2032 Li battery with a fresh one.

Make sure bluetooth is enabled on the provided tablet. Do **not** upgrade the operating system. Open the "Sensor MAX86150 EV" by clicking the teal logo. Then, follow the Quick Start → Procedure for details on EV kit operation.

If you are either unable to connect, or do not see the "Maxim BT 2.0" upon android application launch, make sure bluetooth is enabled, the device is powered on, and the blue LED is illuminated. The provided tablet's bluetooth functionality

occasionally needs to be toggled off and on to flush the BLE stack. Try turning the bluetooth off and then on from the swipe-down menu on the top-left side of the tablet.

### Lights/Battery

The EV kit has a blue LED indicator light (LD1). The blue light means that the BLE chipset is in advertising mode. The device will stay in this mode until you either swipe left, or press the "ECG+PPG" button in the Android application. At this point, the settings are sent to the device and the handshake is completed, allowing data transmission to begin.

If the blue light is faint, replace the coin cell battery, making sure to place the + side down, as shown in [Figure 19](#). The battery compartment can be removed from the EV kit for easy battery replacement. **Only one coin cell battery is required.**

### ECG Usage

The EV kit has two electrodes. These dry stainless steel electrodes have left and right-hand polarities, and should be contacted such that your middle or index finger is over the sensor, as shown in [Figure 20](#). Both hands must touch the electrodes to measure the electrocardiogram waveform potential. Additionally, PPG signal can be measured simultaneously by using another finger from either hand. Make sure the left and right hand do not touch (electrically short) during the measurement.

NOTES:

- 1) FABRICATE BOARD PER IPC-A-600C
- 2) MATERIAL FR4; 4 LAYER BOARD.
- 3) FINISHED BOARD THICKNESS TO BE 62 MIL(TOLERANCE +/- 10%)
- 4) MINIMUM PLATING IN ALL THE THROUGH HOLE SHALL BE 0.001 INCH Cu.
- 5) ALL HOLES ARE PLATED THROUGH UNLESS OTHERWISE SPECIFIED.
- 6) HOLE SIZE ARE FINISHED SIZE.
- 7) SOLDER MASK BOTH SIDE WITH GREEN LIQUID PHOTO IMAGABLE.
- 8) SILKSCREEN BOTH SIDE "WHITE EPOXY" OVER SOLDER MASK
- 9) DEBURR ALL SHARP EDGES
- 10) BOW AND TWIST: SHOULD NOT EXCEED 0.007" PER INCH.
- 11) PLATING: IMMERSION GOLD FINISH.
- 12) PLATING THICKNESS: 0.5OZ COPPER ON OUTER LAYERS, PLATED TO 1OZ
- 13) CLIP SILKSCREEN UNDER NO MASK AREA
- 14) USE +/-2MILS TOLERANCE FOR 30MIL PLATED THROUGH HOLES.  
ALL OTHER PLATED THRU HOLES ARE +/- 3 MILS TOLERANCE
- 15) ADD FIDUCIAL MARKS ON THE PANELS WHEN PANELIZING THE BOARDS.
- 16) ROUTE THE BOARD OUTLINE AS PER GERBERs.
- 17) IGNORE THE SILK TEXTS FALLING OUTSIDE THE BOARD OUTLINE.
- 18) FAB HOUSE SHOULD NOT MODIFY ANYTHING ON THIS AREA ON BOTTOM SIDE OF THE BOARD.  
THIS AREA SHOULD BE FREE OF SILK OR ANY FAB NAME \ NUMBER ON ETCH - ON BOTTOM SIDE.
- 19) NO IMPEDANCE REQUIRED
- 20) ALL 0.008" & 0.010" PLATED HOLES NEED TO BE NON CONDUCTIVE FILLED AND PLATED OVER, IT SHOULD BE SMOOTH AND FLAT ON BOTH THE SIDES.\*
