

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

Audio/Video Switch for Dual SCART Connector

General Description

The MAX9595 dual SCART switch matrix routes audio and video signals between an MPEG encoder and two external SCART connectors under I²C control, and meets the requirements of EN50049-1, IEC 933-1, Canal+, and BSkyB standards.

The video and audio channels feature input source selection multiplexers, input buffers, and output buffers for routing all inputs to selected outputs.

The MAX9595 provides programmable gain control from +5dB to +7dB in 1dB steps for red, green, and blue component video signals. All other video outputs have a fixed +6dB gain. Additional features include an internal luma and chroma (Y/C) mixer that generates a composite video signal (CVBS) to supply an RF modulator output, and internal video reconstruction lowpass filters with passband ripple between -1dB and +1dB from 100kHz to 5.5MHz. The MAX9595 TV audio channel features clickless switching and programmable volume control from -56dB to +6dB in 2dB steps. The VCR audio output also has programmable gain for -6dB, 0dB, or +6dB. The device also generates monaural audio from left and right stereo inputs. All audio drivers deliver a 3.0V_{RMS} minimum output.

The MAX9595 operates with standard 5V and 12V power supplies and supports slow-switching and fast-switching signals. The I²C interface programs the gain and volume control, and selects the input source for routing.

The MAX9595 is available in a compact 48-pin thin QFN package and is specified over the 0°C to +70°C commercial temperature range.

Applications

Satellite Set-Top Boxes
Cable Set-Top Boxes
TVs
VCRs
DVDs

Features

- ◆ Video Outputs Drive 2V_{p-p} into 150Ω
- ◆ Audio Outputs Drive 3V_{RMS} into 10kΩ
- ◆ Clickless, Popless Audio Gain Control and Switching
- ◆ Interrupt Output Detects Changes on Slow Switching Input
- ◆ AC-Coupled Video Inputs with Internal Clamp and Bias
- ◆ DC-Coupled Video Outputs
- ◆ Composite Video Signal Created Internally from Y/C Inputs
- ◆ Internal Video Reconstruction Filters Provide -40dB at 27MHz
- ◆ Single-Ended Audio Input
- ◆ Red/Chroma Switch for Bidirectional I/O
- ◆ I²C-Programmable RGB Gain from +5dB to +7dB
- ◆ I²C-Programmable Audio Gain Control from +6dB to -56dB
- ◆ Meets EN50049-1, IEC 933-1, Canal+, and BSkyB Requirements

Ordering Information

PART	TEMP RANGE	PIN-PACKAGE	PKG CODE
MAX9595CTM+	0°C to +70°C	48 Thin QFN-EP* (7mm x 7mm)	T4877-6

*EP = Exposed paddle.

+Denotes lead-free package.

Pin Configuration and Typical Application Circuit appear at end of data sheet.

System Block Diagram appears at end of data sheet.

Audio/Video Switch for Dual SCART Connector

ABSOLUTE MAXIMUM RATINGS

V _{VID} to GNDVID	-0.3V to +6V
V ₁₂ to GNDAUD	-0.3V to +14V
V _{AUD} to GNDAUD	-0.3V to +6V
GNDAUD to GNDVID	-0.1V to +0.1V
All Video Inputs, ENCIN_FS, VCRIN_FS, SET to GNDVID	-0.3V to (V _{VID} + 0.3V)
All Audio Inputs, AUDBIAS to GNDAUD	-0.3V to (V _{AUD} + 0.3V)
SDA, SCL, DEV_ADDR, INTERRUPT_OUT to GNDVID	-0.3V to +6V
All Audio Outputs, TV_SS, VCR_SS to GNDAUD	-0.3V to (V ₁₂ + 0.3V)

INTERRUPT_OUT Current	+50mA
All Video Outputs, TVOUT_FS to V _{VID} , V _{AUD} , GNDAUD, GNDVID	Continuous
All Audio Outputs to V _{VID} , V _{AUD} , V ₁₂ , GNDVID, GNDAUD	Continuous
Continuous Power Dissipation (T _A = +70°C) 48-Pin Thin QFN (derate 27mW/°C above +70°C)	2105.3mW
Operating Temperature Range	0°C to +70°C
Junction Temperature	+150°C
Storage Temperature Range	-65°C to +150°C
Lead Temperature (soldering, 10s)	+300°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

(V₁₂ = 12V, V_{VID} = V_{AUD} = 5V; 0.1μF X5R capacitor in parallel with a 10μF aluminum electrolytic capacitor from V_{AUD} to GNDAUD, V₁₂ to GNDAUD, and V_{VID} to GNDVID; SET = 100kΩ nominal, R_{LOAD} = 150Ω, T_A = 0°C to +70°C, unless otherwise noted. Typical values are at T_A = +25°C.) (Note 1)

PARAMETER	SYMBOL	CONDITIONS	MIN	TYP	MAX	UNITS
V _{VID} Supply Voltage Range	V _{VID}	Inferred from video gain test	4.75	5.0	5.25	V
V _{AUD} Supply Voltage Range	V _{AUD}	Inferred from audio gain test	4.75	5.0	5.25	
V ₁₂ Supply Voltage Range	V ₁₂	Inferred from slow switching levels	11.4	12.0	12.6	
V _{VID} Quiescent Supply Current	I _{VID_Q}	All video output amplifiers are enabled, no load		69	100	mA
V _{VID} Standby Supply Current	I _{VID_Q}	All video output amplifiers are in shutdown, and TV_FS_OUT driver is in shutdown, no load		40	60	mA
V _{AUD} Quiescent Supply Current	I _{AUD_Q}	No load		2.4	6	mA
V ₁₂ Quiescent Supply Current	I _{12_Q}	No load		3.6	6	mA
VIDEO CHARACTERISTICS						
Voltage Gain	G _V	CVBS and Y-C, 1V _{P-P} input	+5.5	+6.0	+6.5	dB
		RGB, 1V _{P-P} input, (programmable gain control)	+4.5	+5.0	+5.5	
			+5.5	+6.0	+6.5	
			+6.5	+7.0	+7.5	
LP Filter Passband Flatness		T _A = +25°C, f = 5.5MHz, V _{IN} = 1V _{P-P}	-1	-0.52	+1	dB
LP Filter Attenuation at 27MHz		T _A = +25°C, f = 27MHz, V _{IN} = 1V _{P-P}	30	40		dB
Slew Rate	SR	V _{OUT} = 2V _{P-P}		16		V/μs
Settling Time	t _S	V _{OUT} = 2V _{P-P} , settle to 0.1% (Note 2)		300		ns
Gain Matching	AG	1V _{P-P} input, between RGB or Y-C	-0.5		+0.5	dB
Differential Gain	DG	5-step modulated staircase		0.4		%
Differential Phase	DP	5-step modulated staircase		0.2		degrees

Fast Switching Output to RGB Skew		(Note 5)		30		ns
Fast Switching Output Rise Time		150 Ω to ground		30		ns
Fast Switching Output Fall Time		150 Ω to ground		30		ns

Note 1: All devices are 100% tested at $T_A = +25^\circ C$. All temperature limits are guaranteed by design.

Note 2: The settling time is measured from the 50% of the input swing to the 0.1% of the final value of the output.

Note 3: Maximum load capacitance is 200pF. All the listed parameters are measured at application's inputs, unless otherwise noted. See the *Typical Application Circuits*.

Note 4: Guaranteed by design.

Note 5: Difference in propagation delays of fast-blanking signal and RGB signals. Measured from 50% input transition to 50% output transition. Signal levels to be determined.

Typical Operating Characteristics

Typical values are at $T_A = +25^\circ C$.)

Audio/Video Switch for Dual SCART Connector

Pin Description

MAX9595

PIN	NAME	FUNCTION
1	SDA	Bidirectional Data I/O. I ² C -compatible, 2-wire interface data input/output. Output is open drain.
2	SCL	Serial Clock Input. I ² C -compatible, 2-wire clock interface.
3	DEV_ADDR	Device Address Set Input. Connect to GNDVID to set write and read addresses of 94h or 95h, respectively. Connect to V _{VID} to set write and read address of 96h or 97h, respectively.
4	ENC_INL	Digital Encoder Left-Channel Audio Input
5	INTERRUPT_OUT	Interrupt Output. INTERRUPT_OUT is an open-drain output that goes high impedance to indicate a change in the slow switch lines, TV_SS or VCR_SS.
6	ENC_INR	Digital Encoder Right-Channel Audio Input
7	N.C.	No Connection. Not internally connected.
8	VCR_INR	VCR SCART Right-Channel Audio Input
9	VCR_INL	VCR SCART Left-Channel Audio Input
10	TV_INR	TV SCART Right-Channel Audio Input
11	TV_INL	TV SCART Right-Channel Audio Input
12	GNDAUD	Audio Ground
13	AUD_BIAS	Audio Input Bias Voltage. Bypass AUD_BIAS with a 47μF capacitor and a 0.1μF capacitor to AUDGND.
14	V _{AUD}	Audio Supply. Connect to a +5V supply. Bypass with a 10μF aluminum electrolytic capacitor in parallel with a 0.47μF low-ESR ceramic capacitor to GNDAUD.
15	VCR_OUTR	VCR SCART Right-Channel Audio Output
16	VCR_OUTL	VCR SCART Left-Channel Audio Output
17	RF_MONO_OUT	RF Modulator Mono Audio Output
18	TV_OUTL	TV SCART Left-Channel Audio Output
19	TV_OUTR	TV SCART Right-Channel Audio Output
20	V ₁₂	+12V Supply. Bypass V ₁₂ with a 10μF capacitor in parallel with a 0.1μF capacitor to ground.
21	TV_SS	TV SCART Bidirectional Slow-Switch Signal
22	VCR_SS	VCR SCART Bidirectional Slow-Switch Signal
23	SET	Filter Cutoff Frequency Set Input. Connect 100kΩ resistor from SET to ground.
24, 36	V _{VID}	Video and Digital Supply. Connect to a +5V supply. Bypass with a 0.01μF capacitor to GNDVID. V _{VID} also serves as a digital supply for the I ² C interface.
25	VCRIN_FS	VCR SCART Fast-Switching Input
26	ENCIN_FS	Digital Encoder Fast-Switching Input
27	TVOUT_FS	TV SCART Fast-Switching Output. This signal is used to switch the TV to its RGB inputs for on-screen display purposes.
28	GNDVID	Video Ground
29	RF_CVBS_OUT	RF Modulator Composite Video Output. Internally biased at 1V.
30	TV_Y/CVBS_OUT	TV SCART Luma/Composite Video Output. Internally biased at 1V.
31	TV_R/C_OUT	TV SCART Red/Chroma Video Output. Internally biased at 1V for red video signal and 2.2V for chroma video signal.

Audio/Video Switch for Dual SCART Connector

Pin Description (continued)

PIN	NAME	FUNCTION
32	TV_G_OUT	TV SCART Green Video Output. Internally biased at 1V.
33	TV_B_OUT	TV SCART Blue Video Output. Internally biased at 1V.
34	VCR_Y/CVBS_OUT	VCR SCART Luma/Composite Video Output. Internally biased at 1V.
35	VCR_R/C_OUT	VCR SCART Red/Chroma Video Output. Internally biased at 1V for red video signals and 2.2V for chroma video signal.
37	TV_R/C_IN	TV SCART Red/Chroma Video Input. Internally biased at 1V for red video signals, or 2.2V for chroma video signals.
38	TV_Y/CVBS_IN	TV SCART Luma/Composite Video Input. Internally biased at 1.2V.
39	VCR_Y/CVBS_IN	VCR SCART Luma/Composite Video Input. Internally biased at 1.2V.
40	VCR_R/C_IN	VCR SCART Red/Chroma Video Input. Internally biased at 1.2V for red video signals and 1.9V for chroma video signals.
41	VCR_G_IN	VCR SCART Green Video Input. Internally biased at 1.2V.
42	VCR_B_IN	VCR SCART Blue Video Input. Internally biased at 1.2V.
43	ENC_Y/CVBS_IN	Digital Encoder Luma/Composite Video Input. Internally biased at 1.2V.
44	ENC_R/C_IN	Digital Encoder Red/Chroma Video Input. Internally biased at 1.2V for red video signals, or 1.9V for chroma video signals.
45	ENC_G_IN	Digital Encoder Green Video Input. Internally biased at 1.2V.
46	ENC_B_IN	Digital Encoder Blue Video Input. Internally biased at 1.2V.
47	ENC_Y_IN	Digital Encoder Luma Video Input. Internally biased at 1.2V.
48	ENC_C_IN	Digital Encoder Chroma Video Input. Internally biased at 1.9V.
EP	GNDAUD	Exposed Paddle. Solder to the circuit board ground (GNDAUD) for proper thermal and electrical performance.

Detailed Description

The MAX9595 is a switch matrix that routes audio and video signals between different ports using the I²C interface. The ports consist of the MPEG decoder output, and two SCART connectors for the TV and VCR. Per EN50049 and IEC 933, the encoder can only input a signal to the SCART connector, while TV and VCR SCART connectors are bidirectional.

The MAX9595 circuitry consists of four major sections: the video section, the audio section, the slow- and fast-switching section, and the digital interface.

The video section consists of clamp and bias circuitry, input buffers, reconstruction filters, a switch matrix, a Y/C mixer, and output buffers. All video inputs are AC-coupled through a 0.1 μ F capacitor to set an acceptable DC level using clamp or bias networks. The bidirectional red/chroma outputs can be connected to ground

using I²C control to make them terminations when red/chroma is an input (see the *Video Inputs* section).

The audio section features an input buffer, a switching matrix, volume- or gain-control circuitry, and output drivers. The audio inputs are AC-coupled through a 0.1 μ F capacitor. The TV output audio path has volume control from -56dB to +6dB in 2dB steps, while the VCR output audio path has volume control from -6dB to +6dB in 6dB steps. The MAX9595 can be configured to switch inputs during a zero-crossing function to reduce clicks.

The slow-switching feature allows for bidirectional, tri-level, slow-switching input and output signals at pin VCR_SS and TV_SS, respectively. The slow-switching signals from the VCR set the aspect ratio or video source of the TV screen. If INTERRUPT_OUT is enabled, then INTERRUPT_OUT changes to a high-impedance state if any of the slow-switching inputs change logic levels. See the *Slow Switching* section.

Audio/Video Switch for Dual SCART Connector

Fast switching consists of two inputs from the encoder and VCR, and one output to the TV to insert an on-screen display (OSD). Fast switching is used to route video signals from the VCR or from the encoder to the TV. In addition, the fast-switching output can be configured to a high or low voltage. Fast switching is controlled through the I²C interface.

The digital block contains the 2-wire interface circuitry, control, and status registers. The MAX9595 can be configured through an I²C-compatible interface. DEV_ADDR sets the I²C-compatible address.

SCART Video Switching

The MAX9595 switches video signals between an MPEG decoder, TV SCART, and VCR SCART. The video switch includes reconstruction filters, multiplexed video amplifiers, and a Y-C mixer driver for an RF modulator. See Figure 1 for the functional diagram of the video section. While the SCART connector supports RGB, S-video, and composite video formats, RGB and S-video typically share a bidirectional set of SCART connector pins.

MAX9595

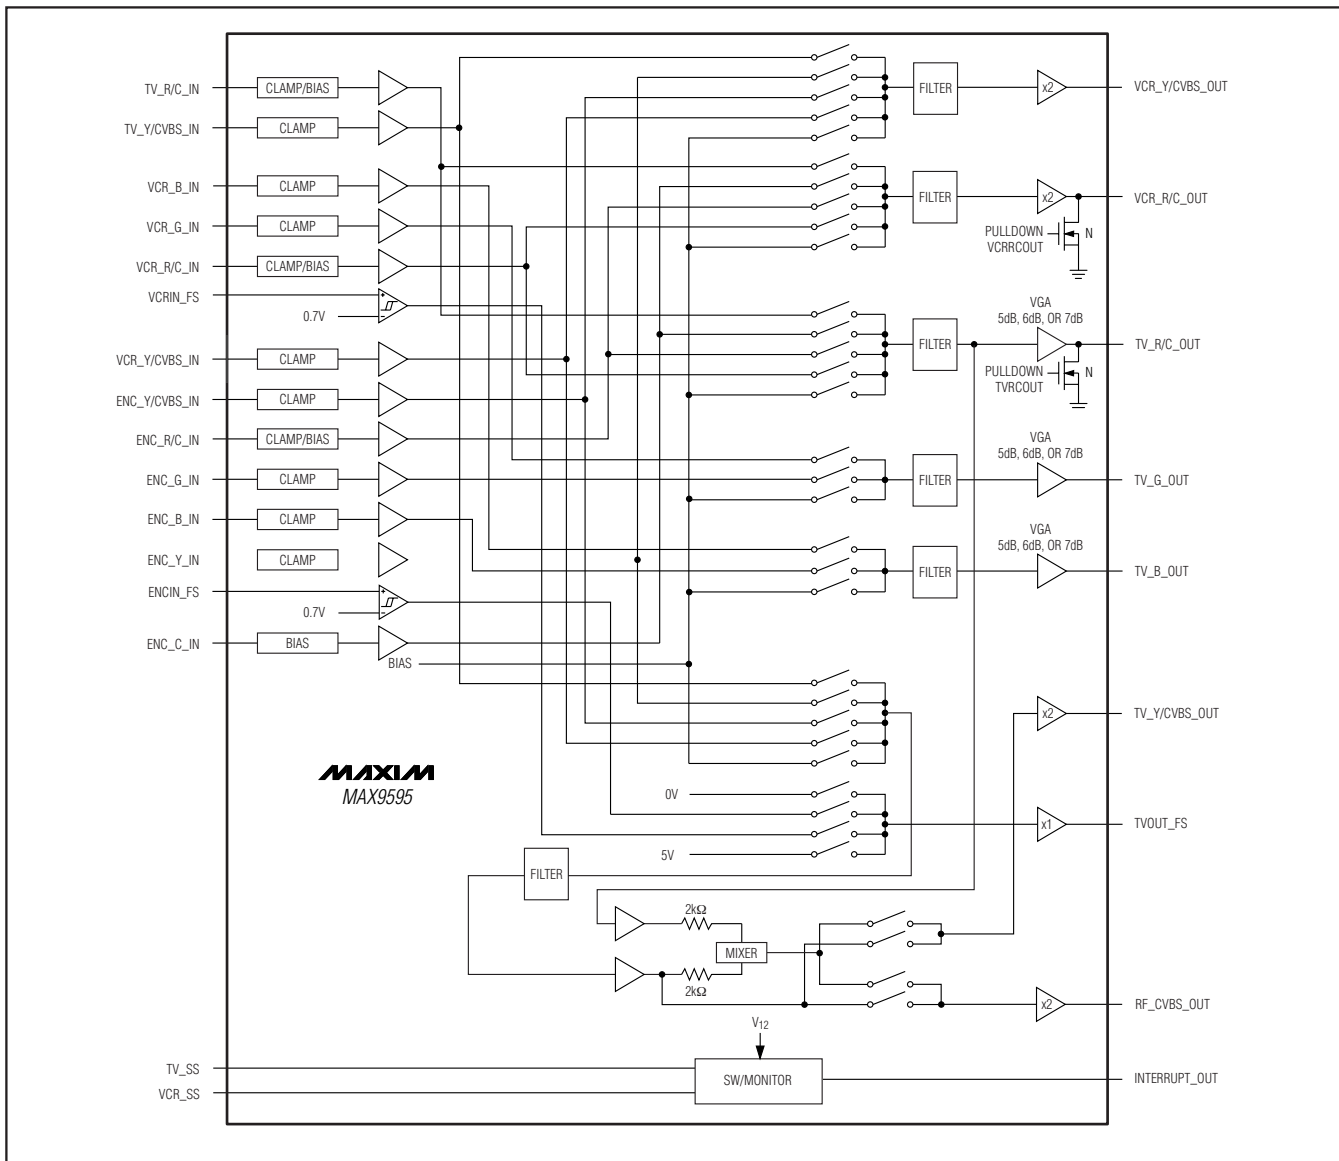

Figure 1. MAX9595 Video Section Functional Diagram

Audio/Video Switch for Dual SCART Connector

Video Inputs

All video inputs are AC-coupled with an external 0.1µF capacitor. Either a clamp or bias circuit sets the DC input level of the video signals. The clamp circuit positions the sync tip of the composite (CVBS), the component RGB, or the S-video luma signal. If the signal does not have a sync tip, then the clamp positions the minimum of the signal at the clamp voltage. The bias circuitry is used to position the S-video chroma signal at midlevel of the luma (Y) signal. On the video inputs that can receive either a chroma or a red video signal, the bias or clamp circuit is selected through I²C. See Tables 3–12 for loading register details.

The MPEG decoder and VCR uses the RGB format and fast switching to insert an on-screen display (OSD), usually text, onto the TV. The MAX9595 supports RGB as an input from either the VCR or the MPEG decoder and as an output only to the TV. The red video signal of the RGB format and the chroma video signal of the S-VHS format share the same SCART connector pin. Therefore, RGB and S-video signals cannot be present at the same time. Loop-through is possible with a composite video signal but not with RGB signals because the RGB SCART pins are used for both input and output.

In SCART, there is the possibility of a bidirectional use of the red/chroma pin. When using the red/chroma pin as an input port, terminate the red/chroma output with a

75Ω resistor to ground. Thus, a ground state is provided by an active pull-down to GNDVID on the red/chroma output to support the bidirectional chroma or red I/O, turning the output source resistors into terminations (see Figure 2). The active pull-down also provides the “Mute Output” function, and disables the deselected video outputs. The “Mute Output” state is the default power-on state for video.

For high-quality home video, the MPEG decoder, VCR, and TV use the S-video format. The MAX9595 supports S-video signals as an input from the VCR, the MPEG decoder, and the TV, and also as a separately switchable output to the TV and VCR. Because S-video support was not included in the original specifications of the SCART connector, the luma (Y) signal of S-video and the CVBS signal share the same SCART connector pins. If S-video is present, then a composite signal must be created from the Y and C signals to drive the RF_CVBS_OUT pin. For S-video, loop-through is not possible since the chroma SCART port is used for both input and output.

The MAX9595 supports composite video (CVBS) format, with inputs from the VCR, MPEG decoder, and TV. Full loop-through is possible to the TV and VCR only, since the MPEG decoder SCART connector has separate input and output pins for the CVBS format.

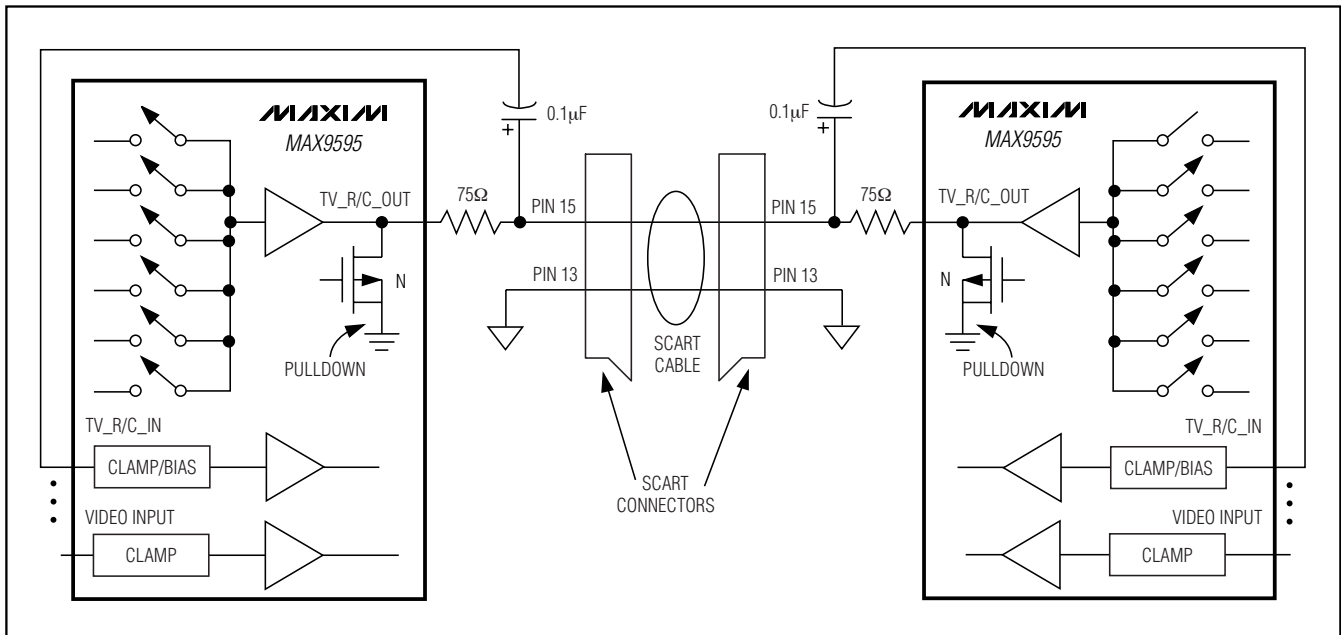

Figure 2. Bidirectional SCART Pins

Audio/Video Switch for Dual SCART Connector

Video Outputs

The DC level at the video outputs is controlled so that coupling capacitors are not required, and all of the video outputs are capable of driving a DC-coupled, 150Ω, back-terminated coax load with respect to ground. In a typical television input circuit (see Figure 3), the video output driver on the SCART chip only needs to source current. Users should note that, while the SCART specification states 75Ω impedance, in practice, typical SCART chip implementations assume 75Ω input resistance to ground (and source current from the video output stage). Since some televisions and VCRs use the horizontal sync height for automatic gain control, the MAX9595 accurately reproduces the sync height to within ±2%.

Slow Switching

The MAX9595 supports the IEC 933-1, Amendment 1, tri-level slow switching that selects the aspect ratio for the display (TV). Under I²C-compatible control, the MAX9595 sets the slow-switching output voltage level. Table 1 shows the valid input levels of the slow-switching signal and the corresponding operating modes of the display device.

Two bidirectional ports are available for slow-switching signals for the TV and VCR. The slow-switching input status is continuously read and stored in register 0Eh. The slow-switching outputs can be set to a logic level or high impedance by writing to registers 07h and 09h. See Tables 8 and 10 for details. When enabled, INTERRUPT_OUT becomes high impedance if the voltage level changes on TV_SS or VCR_SS.

Fast Switching

The VCR or MPEG decoder outputs a fast-switching signal to the display device or TV to insert on-screen display (OSD). The fast-switching signal can also be set to a constant high or low output signal through the I²C interface. The fast-switching output can be set through writing to register 07h.

Y/C Mixer

The MAX9595 includes an on-chip mixer to produce composite video (CVBS) when S-video (Y and C) is present. The composite video drives the RF_CVBS_OUT output pin. The circuit sums Y and C signals to obtain the CVBS component. A +6dB output buffer drives RF_CVBS_OUT.

Video Reconstruction Filter

The encoder DAC outputs need to be lowpass-filtered to reject the out-of-band noise. The MAX9595 integrates the reconstruction filter. The filter is fourth order, which is composed of two Sallen-Key biquad in cascade, implementing a Butterworth-type transfer function. The internal reconstruction filters feature a 5.5MHz cutoff frequency, and -30dB minimum attenuation at 27MHz. Note that the SET pin is used to set the accuracy of the filter cutoff frequency. Connect a 100kΩ resistor from SET to ground.

SCART Audio Switching

Audio Inputs

The audio block has three stereo audio inputs from the TV, the VCR, and the MPEG decoder SCART. Each input has a 100kΩ resistor connected to an internally generated voltage equal to 0.23 x V₁₂, and is AC-coupled.

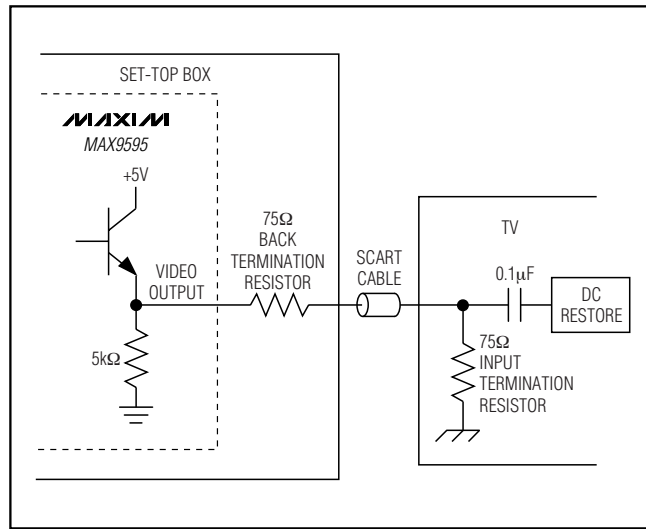

Figure 3. Typical TV Input Current

Table 1. Slow-Switching Modes

SLOW-SWITCHING SIGNAL VOLTAGE (V)	MODE
0 to 2	Display device uses an internal source such as a built-in tuner to provide a video signal
4.5 to 7.0	Display device uses a video signal from the SCART connector and sets the display to 16:9 aspect ratio
9.5 to 12.6	Display device uses a signal from the SCART connector and sets the display to 4:3 aspect ratio

Audio/Video Switch for Dual SCART Connector

Audio Outputs

Both right and left channels have a stereo output for the TV and VCR SCART. The monaural output, which is a mix of the TV right and left channels, drives the RF modulator, RF_MONO_OUT. The monaural mixer, a resistor summer, attenuates the amplitude of each of the two signals by 6dB. A 12.54dB gain block follows the monaural mixer. If the left and right audio channels

were completely uncorrelated, then a 9.54dB gain block is used. See Figure 4 for the functional diagram of the audio section.

Clickless Switching

The TV channel incorporates a zero-crossing detect (ZCD) circuit that minimizes click noise due to abrupt signal level changes that occur when switching between audio signals at an arbitrary moment.

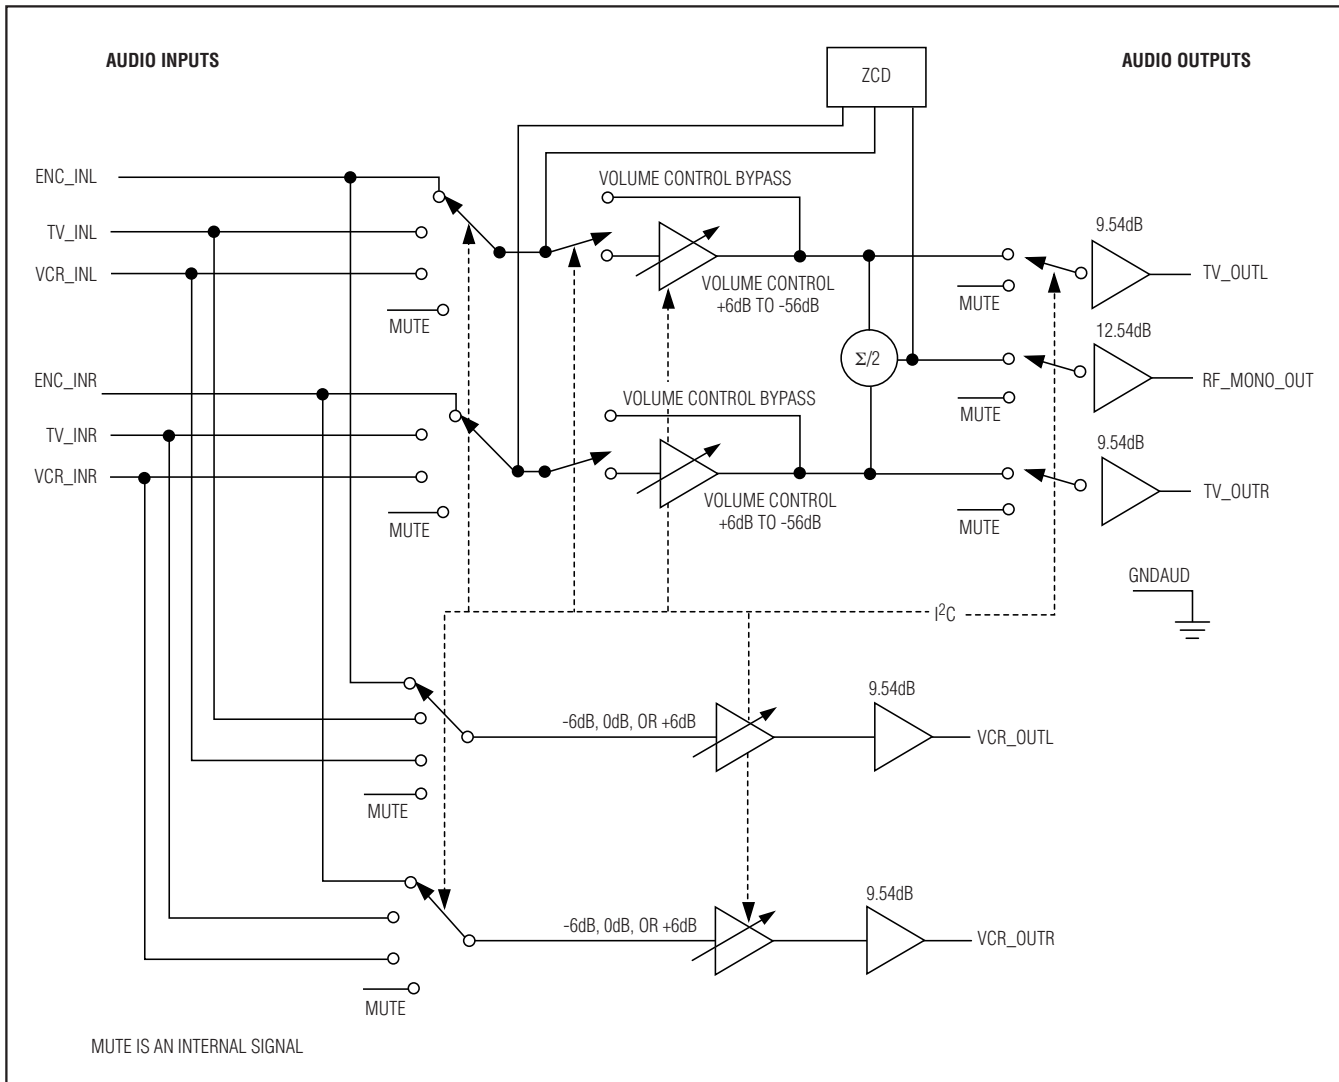

Figure 4. MAX9595 Audio Section Functional Diagram

Audio/Video Switch for Dual SCART Connector

To implement the zero-crossing function when switching audio signals, set the ZCD bit by loading register 00h through the I²C-compatible interface (if the ZCD bit is not already set). Then set the mute bit low by loading register 00h. Next, wait for a sufficient period of time for the audio signal to cross zero. This period is a function of the audio signal path's low-frequency 3dB corner (f_{L3dB}). Thus, if $f_{L3dB} = 1\text{kHz}$, the time period to wait for a zero-crossing detect is 0.5kHz or 0.5ms.

Next, set the appropriate TV switches using register 01h. Finally, clear the mute bit (while leaving the ZCD bit high) using register 00h. The MAX9595 switches the signal out of mute at the next zero crossing.

To implement the zero-cross function for TV volume changes, or for TV and phono volume bypass switching, simply ensure the ZCD bit in register 00h is set.

Volume Control

The TV channel volume control ranges from -56dB to +6dB in 2dB steps. The VCR volume control settings are programmable for -6dB, 0dB, and +6dB. These gain levels are referenced to the application inputs, where some dividers are present. With the ZCD bit set, the TV volume control switches only at zero-crossings, thus minimizing click noise. The TV outputs can bypass the volume control. Likewise, the monaural output signal can be processed by the TV volume control or it can bypass the volume control.

Digital Section

Serial Interface

The MAX9595 uses a simple 2-wire serial interface requiring only two standard microprocessor port I/O lines. The fast-mode I²C-compatible serial interface allows communication at data rates up to 400kbps or 400kHz. Figure 5 shows the timing diagram of the signals on the 2-wire interface.

The two bus lines (SDA and SCL) must be at logic-high when the bus is not in use. The MAX9595 is a slave device and must be controlled by a master device. Pullup resistors from the bus lines to the supply are required when push-pull circuitry is not driving the lines.

The logic level on the SDA line can only change when the SCL line is low. The start and stop conditions occur when SDA toggles low/high while the SCL line is high (see Figure 5). Data on SDA must be stable for the duration of the setup time ($t_{SU,DAT}$) before SCL goes high. Data on SDA is sampled when SCL toggles high with data on SDA stable for the duration of the hold time ($t_{HD,DAT}$). Note that data is transmitted in an 8-bit byte. A total of nine clock cycles are required to transfer a byte to the MAX9595. The device acknowledges the successful receipt of the byte by pulling the SDA line low during the 9th clock cycle.

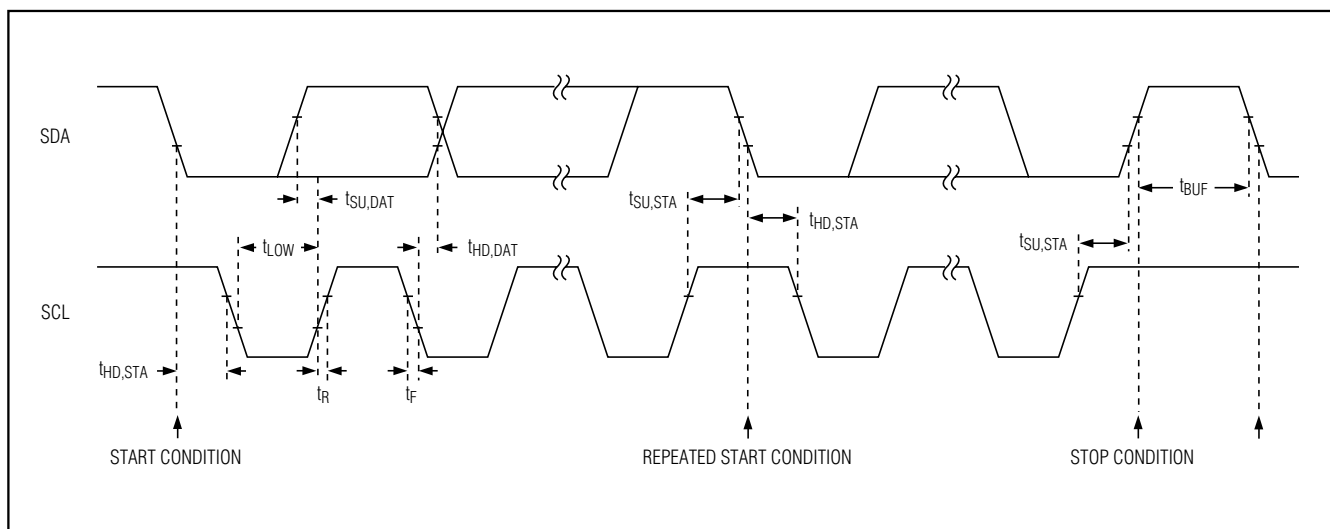

Figure 5. SDA and SCL Signal Timing Diagram

---	--	---	---------------------	---	----	---------------------------------------	---	------	----	---

S = Start Condition, A = Acknowledge, NA = Not Acknowledge, Sr = Repeat Start Condition, P = Stop Condition

I²C Compatibility

The MAX9595 is compatible with existing I²C systems. SCL and SDA are high-impedance inputs. SDA has an open drain that pulls the bus line to a logic-low during the 9th clock pulse. Figure 6 shows a typical I²C interface application. The communication protocol supports the standard I²C 8-bit communications. The MAX9595 address is compatible with the 7-bit I²C addressing protocol only; 10-bit format is not supported.

Digital Inputs and Interface Logic

The I²C-compatible, 2-wire interface has logic levels defined as V_{IL} = 0.8V and V_{IH} = 2.0V. All of the inputs include Schmitt-trigger buffers to accept low-transition interfaces. The digital inputs are compatible with 3V CMOS logic levels.

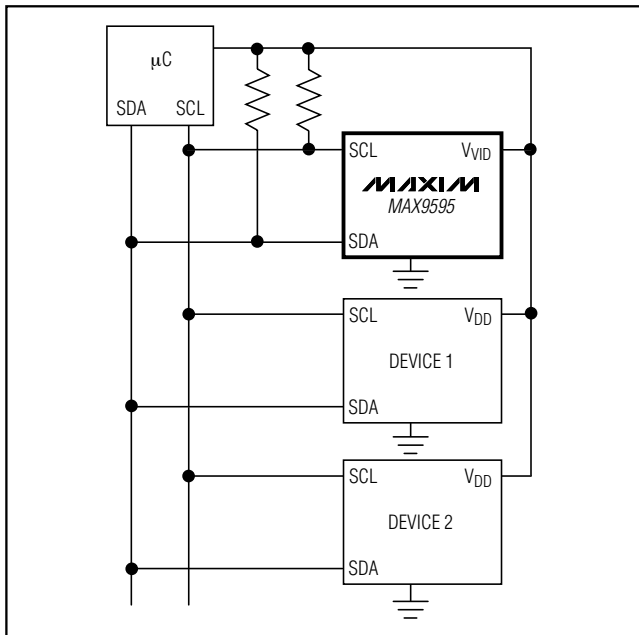

Figure 6. Typical I²C Interface Application

Programming

Connect DEV_ADDR to ground to set the MAX9595 write and read address as shown in Table 2.

Table 2. Slave Address Programming

ADDRESS PIN STATE	WRITE ADDRESS	READ ADDRESS
V _{VID}	96h	97h
GNDVID	94h	95h

Data Register Writing and Reading

Program the SCART video and audio switches by writing to registers 00h through 0Dh. Registers 00h through 0Eh can also be read, allowing read-back of data after programming and facilitating system debugging. The status register is read-only and can be read from address 0Eh. See Tables 3–12 for register programming information.

INTERRUPT_OUT Signal

INTERRUPT_OUT is an open-drain output that becomes high impedance when a change in any of the slow-switch signals occurs. Clear INTERRUPT_OUT by setting bit 4 of register 01h low.

Applications Information

Hot-Plug of SCART Connectors

The MAX9595 features high-ESD protection on all SCART inputs and outputs, and requires no external transient-voltage suppressor (TVS) devices to protect against floating chassis discharge. Some set-top boxes have a floating chassis problem in which the chassis is not connected to earth ground. As a result, the chassis can charge up to 500V. When a SCART cable is connected to the SCART connector, the charged chassis can discharge through a signal pin. The equivalent circuit is a 2200pF capacitor charged to 311V connected through less than 0.1Ω to a signal pin. The MAX9595 is soldered on the PC board when it experiences such a discharge. Therefore, the current spike flows through the ESD protection diodes and is absorbed by the supply bypass capacitors, which have high capacitance and low ESR.

To better protect the MAX9595 against excess voltages during the cable discharge condition, place an additional 75Ω resistor in series with all inputs and outputs to the SCART connector. For harsh environments where ±15kV protection is needed, the MAX4385E and MAX4386E single and quad high-speed op amps feature the industry's first integrated ±15kV ESD protection on video inputs and outputs.

Audio/Video Switch for Dual SCART Connector

Power Supplies and Bypassing

The MAX9595 features single 5V and 12V supply operation and requires no negative supply. The +12V supply V₁₂ is for the SCART switching function. For pin V₁₂, place all bypass capacitors as close as possible with a 10 μ F capacitor in parallel with a 0.1 μ F ceramic capacitor. Connect all V_{AUD} pins together to +5V and bypass with a 10 μ F electrolytic capacitor in parallel with a 0.47 μ F low-ESR ceramic capacitor to audio ground. Bypass V_{AUD} pins with a 0.1 μ F capacitor to audio ground. Bypass AUD_BIAS to audio ground with a 10 μ F electrolytic in parallel with a 0.1 μ F ceramic capacitor.

Bypass V_{DIG} with a 0.1 μ F ceramic capacitor to digital ground. Bypass each V_{VID} to video ground with a 0.1 μ F ceramic capacitor. Connect V_{VID} in series with a 200nH ferrite bead to the +5V supply.

Layout and Grounding

For optimal performance, use controlled-impedance traces for video signal paths and place input termination resistors and output back-termination resistors close to the MAX9595. Avoid routing video traces parallel to high-speed data lines.

The MAX9595 provides separate ground connections for video, audio, and digital supplies. For best performance, use separate ground planes for each of the ground returns and connect all three ground planes together at a single point. Refer to the MAX9595 evaluation kit for a proven circuit board layout example.
