

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of “Quality Parts,Customers Priority,Honest Operation,and Considerate Service”,our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

36V, Precision, Low-Noise, Wide-Band Amplifier

MAX9632

General Description

The MAX9632 is a low-noise, precision, wide-band operational amplifier that can operate in a very wide +4.5V to +36V supply voltage range. The IC operates in dual ($\pm 18V$) mode.

The exceptionally fast settling time and low distortion make the IC an excellent solution for precision acquisition systems. The rail-to-rail output swing maximizes the dynamic range when driving high-resolution 24-bit $\Sigma\Delta$ ADCs even with low supply voltages.

The IC achieves 55MHz of gain-bandwidth product and ultra-low $0.94nV/\sqrt{Hz}$ input voltage noise with only 3.9mA of quiescent current.

The IC is offered in 8-pin SO, μ MAX®, and TDFN packages and is rated for operation over the $-40^{\circ}C$ to $+125^{\circ}C$ temperature range.

Applications

High-Resolution ADC Drivers
High-Resolution DAC Buffers
Medical Imaging
Low-Noise Signal Processing
Test and Measurement Systems
ATE

μ MAX is a registered trademark at Maxim Integrated Products, Inc.

Features

- ◆ $0.94nV/\sqrt{Hz}$ Ultra-Low Input Voltage Noise
- ◆ Very Fast 600ns Settling Time to 16-Bit Accuracy
- ◆ THD of $-128dB$ at 10kHz
- ◆ Low Input Offset Voltage 125 μ V (max)
- ◆ Low Input Offset Temperature Drift $0.5\mu V/^{\circ}C$ (max)
- ◆ Gain-Bandwidth Product 55MHz
- ◆ +4.5V to +36V Wide Supply Range
- ◆ Rail-to-Rail Output
- ◆ Unity-Gain Stable
- ◆ 8-Pin SO and TDFN Packages
- ◆ ESD 8kV HBM and 1kV CDM

36V, Precision, Low-Noise, Wide-Band Amplifier

ABSOLUTE MAXIMUM RATINGS

VCC to VEE	-0.3V to +40V
All Other Pins.....	(VEE - 0.3V) to (VCC + 0.3V)
Short-Circuit (GND) Duration, OUT.....	10s
Continuous Input Current (any pin).....	±20mA
Continuous Power Dissipation (TA = +70°C) (Note 1)	
Multilayer SO (derate 7.4mW/°C above +70°C)	588mW
Multilayer TDFN (derate 23.8mW/°C above +70°C).....	1905mW
Multilayer μMAX (derate 4.8mW/°C above +70°C).....	387.8mW

ESD Protection

HBM.....	8kV
CDM.....	1kV
Operating Temperature Range.....	-40°C to +125°C
Junction Temperature	+150°C
Lead Temperature (soldering, 10s)	+300°C
Soldering Temperature (reflow)	+260°C

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

PACKAGE THERMAL CHARACTERISTICS (Note 1)

6 TDFN

Junction-to-Ambient Thermal Resistance (θ_{JA})	42°C/W
Junction-to-Case Thermal Resistance (θ_{JC})	8°C/W

8 SO

Junction-to-Ambient Thermal Resistance (θ_{JA})	136°C/W
Junction-to-Case Thermal Resistance (θ_{JC})	38°C/W

8 μMAX

Junction-to-Ambient Thermal Resistance (θ_{JA})	206.3°C/W
Junction-to-Case Thermal Resistance (θ_{JC})	42°C/W

Note 1: Package thermal resistances were obtained using the method described in JEDEC specification JESD51-7, using a four-layer board. For detailed information on package thermal considerations, refer to www.maxim-ic.com/thermal-tutorial.

ELECTRICAL CHARACTERISTICS

(VCC = 15V, VEE = -15V, RL = 10kΩ to VGND, VIN+ = VIN- = VGND = 0V, VSHDN = VGND, TA = -40°C to +125°C. Typical values are at TA = +25°C, unless otherwise noted.) (Note 2)

36V, Precision, Low-Noise, Wide-Band Amplifier

Pin Configuration

MAX9632

Pin Description

PIN	NAME	FUNCTION
1, 5	N.C.	Not Connected
2	IN-	Negative Input
3	IN+	Positive Input
4	VEE	Negative Supply Voltage
6	OUT	Output
7	VCC	Positive Supply Voltage
8	SHDN	Active-High Shutdown
—	EP	Exposed Pad (TDFN Only). Connect to a large VEE plane to maximize thermal performance. Not intended as an electrical connection point.

36V, Precision, Low-Noise, Wide-Band Amplifier

Detailed Description

The MAX9632 is designed in a new 36V, high-speed complementary BiCMOS process that is optimized for excellent AC dynamic performance combined with high-voltage operation.

The IC offers precision, high-bandwidth, ultra-low noise and exceptional distortion performance.

The IC is unity-gain stable and operates either with single-supply voltage up to 36V or with dual supplies up to $\pm 18V$.

Applications Information

Operating Supply Voltage

The IC can operate with dual supplies from $\pm 2.25V$ to $\pm 18V$ or with a single supply from $+4.5V$ to $+36V$ with respect to ground. Even though the IC supports high-voltage operation with excellent performance, the device can also operate in very popular applications at 5V.

Low Noise and Low Distortion

The IC is designed for extremely low-noise applications such as professional audio equipment, very high performance instrumentations, automated test equipment, and medical imaging. The low noise, combined with fast settling time, makes it ideal to drive high-resolution sigma-delta or SARs analog-to-digital converters.

The IC is also designed for ultra-low-distortion performance. THD specifications in the *Electrical Characteristics* table and *Typical Operating Characteristics* are calculated up to the fifth harmonic. Even when driving high-voltage swing up to 10V_{P-P}, the IC maintains excellent low distortion operation over and above 100kHz of bandwidth.

Rail-to-Rail Output Stage

The output stage swings to within 50mV (typ) of either power-supply rail with a 10k Ω load and provides a 55MHz GBW with a 30V/s slew rate. The device is unity-gain stable and can drive a 100pF capacitive load without compromising stability. Stability with higher capacitive loads can be improved by adding an isolation resistor in series with the op-amp output. This resistor improves the circuit's phase margin by isolating the load capacitor from the amplifier's output. The *Typical Operating Characteristics* show a profile of the isolation resistor and capacitive load values that maintain the device into the stable region.

Figure 1. Input Protection Circuit

Input Differential Voltage Protection

During normal op-amp operation, the inverting and noninverting inputs of the IC are at essentially the same voltage. However, either due to fast input voltage transients or other fault conditions, these inputs can be forced to be at two different voltages.

Internal back-to-back diodes protect the inputs from an excessive differential voltage (Figure 1). Therefore, IN+ and IN- can be any voltage within the range shown in the *Absolute Maximum Ratings* section. Note the protection time is still dependent on the package thermal limits.

If the input signal is fast enough to create the internal diodes' forward bias condition, the input signal current must be limited to 20mA or less. If the input signal current is not inherently limited, an input series resistor can be used to limit the signal input current. Care should be taken in choosing the input series resistor value, since it degrades the low-noise performance of the device.

Shutdown

The shutdown is referenced to the positive supply. See the *Electrical Characteristics* table for the proper levels of functionality. A high level (above $V_{CC} - 0.35V$) disables the op amp and puts the output into a high-impedance state. A low level (below $V_{CC} - 3V$) enables the device. As an example, if the op amp is powered with dual supplies of $\pm 15V$, the device is enabled when shutdown is at or below 12V. The device is disabled when shutdown is at or above 14.65V. If the op amp is powered with a single supply of 36V, the device is enabled when shutdown is at or below 33V. The device is disabled when shutdown is at or above 35.65V. This input must be connected to a valid high or low voltage and should not be left disconnected.

Power Supplies and Layout

The MAX9632 can operate with dual supplies from $\pm 2.25V$ to $\pm 18V$ or with a single supply from $+4.5V$ to $+36V$ with respect to ground. When used with dual supplies, bypass both V_{CC} and V_{EE} with their own 0.1 μF capacitor to ground. When used with a single supply, bypass V_{CC} with a 0.1 μF capacitor to ground.

36V, Precision, Low-Noise, Wide-Band Amplifier

Careful layout technique helps optimize performance by decreasing the amount of stray capacitance at the op amp's inputs and outputs. To decrease stray capacitance, minimize trace lengths by placing external components close to the op amp's pins.

For high-frequency designs, ground vias are critical to provide a ground return path for high-frequency signals and should be placed near the decoupling capacitors. Signal routing should be short and direct to avoid parasitic effects. Avoid using right angle connectors since they may introduce a capacitive discontinuity and ultimately limit the frequency response.

Electrostatic Discharge (ESD)

The IC has built-in circuits to protect it from ESD events. An ESD event produces a short, high-voltage pulse that is transformed into a short current pulse once it discharges through the device. The built-in protection circuit provides a current path around the op amp that prevents it from being damaged. The energy absorbed by the protection circuit is dissipated as heat.

ESD protection is guaranteed up to $\pm 8\text{kV}$ with the Human Body Model (HBM). The Human Body Model simulates the ESD phenomenon wherein a charged body directly transfers its accumulated electrostatic charge to the ESD-sensitive device. A common example of this phenomenon is when a person accumulates static charge by walking across a carpet and then transfers all of the charge to an ESD-sensitive device by touching it.

Not all ESD events involve the transfer of charge into the device. ESD from a charged device to another body is also a common form of ESD.

If a charged device comes into contact with another conductive body that is at a lower potential, it discharges into that body. Such an ESD event is known as Charged Device Model (CDM) ESD, which can be even more destructive than HBM ESD (despite its shorter pulse duration) because of its high current. The IC guarantees CDM ESD protection up to $\pm 1\text{kV}$.

Driving High-Resolution Sigma-Delta ADCs

The MAX9632's excellent AC specifications and 55MHz bandwidth are a good fit for driving high-speed, precision delta-sigma ADCs. These ADCs require an ultra-low noise op amp to achieve signal-to-noise ratios (SNR) better than 100dB. The MAX11040 is a 24-bit, 4-channel, simultaneous-sampling ADC with 117dB SNR at 1ksps and 106dB at 16ksps. The MAX11040 measures analog inputs up to $\pm 2.2\text{V}$. Sampling up to 64ksps, the MAX11040 achieves better than -94dB THD and 94dB SFDR.

The MAX11040 measures four differential inputs simultaneously, outputting the data through an SPI™ interface to allow daisy-chaining the data outputs and inputs together. Therefore, up to eight MAX11040 devices can be placed in parallel to measure up to 32 inputs simultaneously. This is ideal for 3-phase power monitoring that requires multiple current and voltage readings and very wide dynamic range.

The *Typical Application Circuit* shows an example of the MAX9632 driving the MAX11040.
