Chipsmall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from,Europe,America and south Asia,supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts,Customers Priority,Honest Operation,and Considerate Service",our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip,ALPS,ROHM,Xilinx,Pulse,ON,Everlight and Freescale. Main products comprise IC,Modules,Potentiometer,IC Socket,Relay,Connector.Our parts cover such applications as commercial,industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

MB88151A is a clock generator for EMI (Electro Magnetic Interference) reduction. The peak of unnecessary radiation noise (EMI) can be attenuated by making the oscillation frequency slightly modulate periodically with the internal modulator. It corresponds to both of the center spread which modulates frequency in modulation off as Middle Centered and down spread which modulates so as not to exceed frequency in modulation off.

5. Handling Devices

5.1 Preventing Latch-up

A latch-up can occur if, on this device, (a) a voltage higher than V_{DD} or a voltage lower than V_{SS} is applied to an input or output pin or (b) a voltage higher than the rating is applied between V_{DD} pin and V_{SS} pin. The latch-up, if it occurs, significantly increases the power supply current and may cause thermal destruction of an element. When you use this device, be very careful not to exceed the maximum rating.

5.2 Handling unused pins

Do not leave an unused input pin open, since it may cause a malfunction. Handle by, using a pull-up or pull-down resistor.

Unused output pin should be opened.

5.3 The attention when the external clock is used

Input the clock to XIN pin, and XOUT pin should be opened when you use the external clock.
Please pay attention so that an overshoot and an undershoot do not occur to an input clock of XIN pin.

5.4 Power supply pins

Please design connecting the power supply pin of this device by as low impedance as possible from the current supply source.

We recommend connecting electrolytic capacitor (about 10 μF) and the ceramic capacitor (about 0.01 μF) in parallel between V_{SS} pin and V_{DD} pin near the device, as a bypass capacitor.

5.5 Oscillation circuit

Noise near the XIN and XOUT pins may cause the device to malfunction. Design printed circuit boards so that electric wiring of XIN or XOUT pin and the resonator do not intersect other wiring.

Design the printed circuit board that surrounds the XIN and XOUT pins with ground.

7. Pin Setting

When changing the pin setting, the stabilization wait time for the modulation clock is required. The stabilization wait time for the modulation clock take the maximum value of "Electrical Characteristics AC Characteristics Lock-up time".

ENS modulation enable setting (MB88151A-100/200/400/500/800)

ENS	Modulation
L	No modulation
H	Modulation

Note : Spectrum does not spread when "L" is set to ENS. The clock with low jitter can be obtained. Because of ENS has Pull-up resistance, spectrum spread when "H" is set to it or open the terminal.

Undershoot	V_{IUNDER}	$V_{SS} - 1.0$ ($t_{UNDER} \leq 50$ ns)	――	V

* : The parameter is based on $V_{SS} = 0.0$ V.

WARNING: Semiconductor devices can be permanently damaged by application of stress (voltage, current, temperature, etc.) in excess of absolute maximum ratings. Do not exceed these ratings.
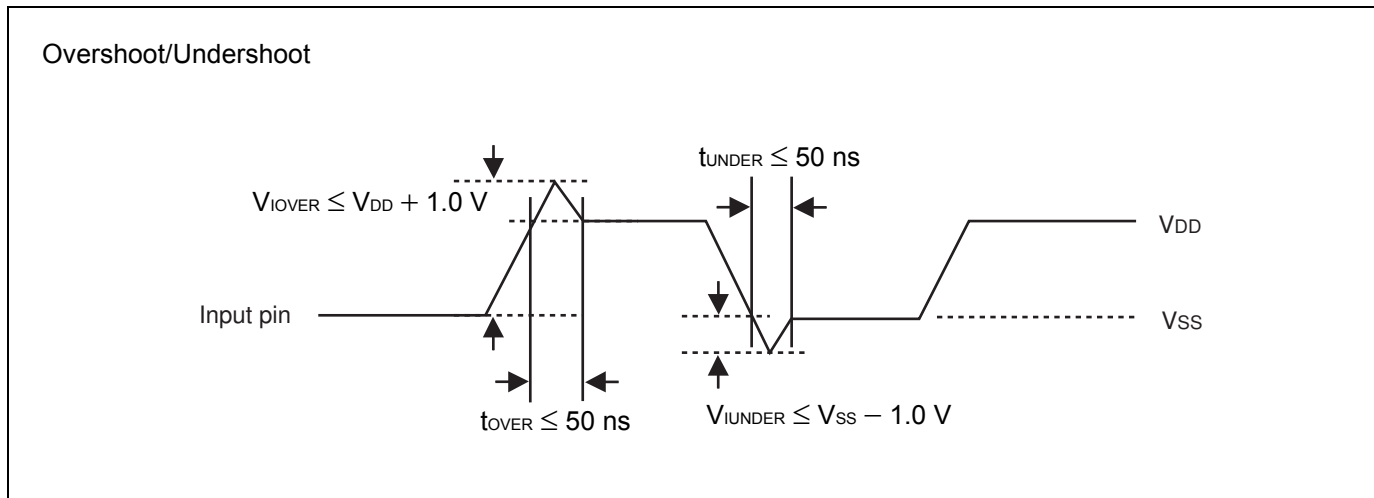

9. Recommended Operating Conditions

$(V_{SS} = 0.0\ V)$

Parameter	Symbol	Pin	Conditions	Value			Unit

Input clock duty cycle	t_{DCI}	XIN	8.3 MHz to 33.4 MHz	40	50	60	%
Operating temperature	Ta	—	—	– 40	—	+ 85	°C

WARNING: The recommended operating conditions are required in order to ensure the normal operation of the semiconductor device. All of the device's electrical characteristics are warranted when the device is operated within these ranges.

Always use semiconductor devices within their recommended operating condition ranges. Operation outside these ranges may adversely affect reliability and could result in device failure.

No warranty is made with respect to uses, operating conditions, or combinations not represented on the data sheet. Users considering application outside the listed conditions are advised to contact their representatives beforehand.

Note : The modulation clock stabilization wait time is required after the power is turned on, the IC recovers from power saving, or after FREQ (frequency range) or ENS (modulation ON/OFF) setting is changed. For the modulation clock stabilization wait time, assign the maximum value for lock-up time.
◀Definition of modulation frequency and number of input clocks per modulation▶
MB88151A contains the modulation period to realize the efficient EMI reduction.
The modulation period f_{MOD} depends on the input frequency and changes between f_{MOD} (Min) and f_{MOD} (Max) .

Furthermore, the average value of f_{MOD} equals the typical value of the electrical characteristics.

## 14. Cycle-cycle Jitter ($t_{JC} = | t_n - t_{n+1} |$)

Note : Cycle-cycle jitter is defined the difference between a certain cycle and immediately after
   (or, immediately before) .

15. Modulation Waveform

■ ±1.5% modulation rate, Example of center spread

■ −1.0% modulation rate, Example of down spread
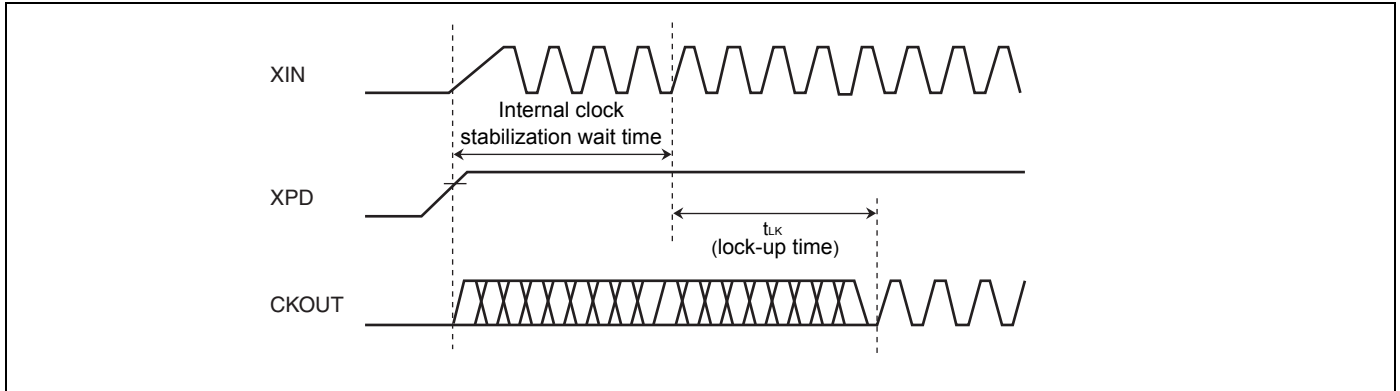

16. Lock-up Time

If the setting pin is fixed at the "H" or "L" level, the maximum time after the power is turned on until the set clock signal is output from CKOUT pin is (the stabilization wait time of input clock to XIN pin) $+$ (the lock-up time "t_{LK}"). For the input clock stabilization time, check the characteristics of the resonator or oscillator used.
For modulation enable control using the ENS pin during normal operation, the set clock signal is output from CKOUT pin at most the lock-up time (t_{LK}) after the level at the ENS pin is determined.

Note : When the pin setting is changed, the CKOUT pin output clock stabilization time is required. Until the output clock signal becomes stable, the output frequency, output clock duty cycle, modulation period, and cycle-cycle jitter cannot be guaranteed. It is therefore advisable to perform processing such as cancelling a reset of the device at the succeeding stage after the lock-up time.

When the power down is controlled by XPD pin, the desired clock is obtained after the pin is set to H level until the maximum lock-up time t_{LK} is elapsed.
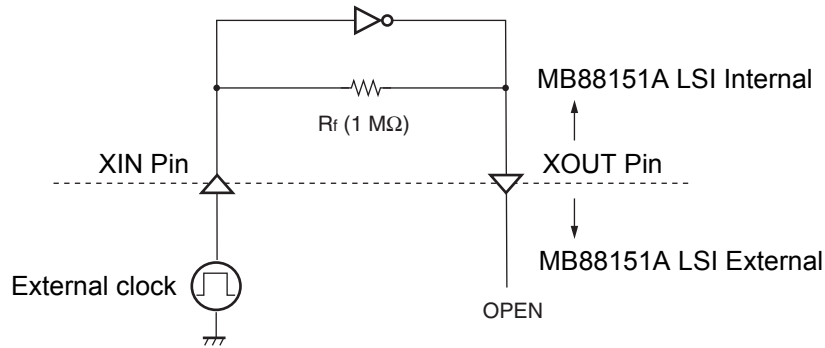

17. Oscillation Circuit

The figure below shows the connection example about general resonator. The oscillation circuit has the built-in resistance (Rf). The value of capacity (C_1 and C_2) is required adjusting to the most suitable value of individual resonator.
The most suitable value is different by individual resonator. Please refer to the resonator manufacturer which you use for the most suitable value.

Input the clock to XIN pin, and do not connect anything with XOUT pin if you use the external clock (you do not use the resonator).

19. Spectrum Example Characteristics

The condition of the examples of the characteristic is shown as follows : Input frequency = 20 MHz (Output frequency = 20 MHz : Using MB88151A-100 (Multiply-by-1)), Power - supply voltage = 3.3 V, None load capacity,
Modulation rate = ± 1.5% (center spread).
Spectrum analyzer HP4396B is connected with CKOUT. The result of the measurement with RBW = 1 kHz
(ATT use for − 6dB).
