# imall

Chipsmall Limited consists of a professional team with an average of over 10 year of expertise in the distribution of electronic components. Based in Hongkong, we have already established firm and mutual-benefit business relationships with customers from, Europe, America and south Asia, supplying obsolete and hard-to-find components to meet their specific needs.

With the principle of "Quality Parts, Customers Priority, Honest Operation, and Considerate Service", our business mainly focus on the distribution of electronic components. Line cards we deal with include Microchip, ALPS, ROHM, Xilinx, Pulse, ON, Everlight and Freescale. Main products comprise IC, Modules, Potentiometer, IC Socket, Relay, Connector. Our parts cover such applications as commercial, industrial, and automotives areas.

We are looking forward to setting up business relationship with you and hope to provide you with the best service and solution. Let us make a better world for our industry!

The following document contains information on Cypress products. Although the document is marked with the name "Spansion" and "Fujitsu", the company that originally developed the specification, Cypress will continue to offer these products to new and existing customers.

#### **Continuity of Specifications**

There is no change to this document as a result of offering the device as a Cypress product. Any changes that have been made are the result of normal document improvements and are noted in the document history page, where supported. Future revisions will occur when appropriate, and changes will be noted in a document history page.

#### **Continuity of Ordering Part Numbers**

Cypress continues to support existing part numbers. To order these products, please use only the Ordering Part Numbers listed in this document.

#### For More Information

Please contact your local sales office for additional information about Cypress products and solutions.

#### **About Cypress**

Cypress (NASDAQ: CY) delivers high-performance, high-quality solutions at the heart of today's most advanced embedded systems, from automotive, industrial and networking platforms to highly interactive consumer and mobile devices. With a broad, differentiated product portfolio that includes NOR flash memories, F-RAM<sup>™</sup> and SRAM, Traveo<sup>™</sup> microcontrollers, the industry's only PSoC<sup>®</sup> programmable system-on-chip solutions, analog and PMIC Power Management ICs, CapSense<sup>®</sup> capacitive touch-sensing controllers, and Wireless BLE Bluetooth<sup>®</sup> Low-Energy and USB connectivity solutions, Cypress is committed to providing its customers worldwide with consistent innovation, best-in-class support and exceptional system value.

# 8-bit Proprietary Microcontroller

# CMOS

# F<sup>2</sup>MC-8L MB89630R Series

# MB89635R/636R/637R/P637/PV630

# 

The MB89630R series has been developed as a general-purpose version of the F<sup>2</sup>MC\*-8L family consisting of proprietary 8-bit, single-chip microcontrollers.

In addition to a compact instruction set, the microcontrollers contain a variety of peripheral functions such as dual-clock control system, five operating speed control stages, a UART, timers, a PWM timer, a serial interface, an A/D converter, an external interrupt, and a watch prescaler.

\* : F<sup>2</sup>MC is the abbreviation for Fujitsu Flexible Microcontroller.

# ■ FEATURES

- · High-speed operating capability at low voltage
- Minimum execution time: 0.4  $\mu s@3.5$  V, 0.8  $\mu s@2.7$  V
- F<sup>2</sup>MC-8L family CPU core

Instruction set optimized for controllers

Multiplication and division instructions 16-bit arithmetic operations Test and branch instructions Bit manipulation instructions, etc.

Five types of timers
8-bit PWM timer: 2 channels (Also usable as a reload timer)
8-bit pulse-width count timer (Continuous measurement capable, applicable to remote control, etc.)
16-bit timer/counter
21-bit timebase timer

(Continued)

For the information for microcontroller supports, see the following web site.

http://edevice.fujitsu.com/micom/en-support/

# **MB89630R Series**

# (Continued)

- UART CLK-synchronous/CLK-asynchronous data transfer capable (6, 7, and 8 bits)
   Serial interface
  - Switchable transfer direction to allows communication with various equipment.
- 10-bit A/D converter Start by an external input capable
- External interrupt: 4 channels Four channels are independent and capable of wake-up from low-power consumption modes (with an edge detection function).
- Low-power consumption modes
   Stop mode (Oscillation stops to minimize the current consumption.)
   Sleep mode (The CPU stops to reduce the current consumption to approx. 1/3 of normal.)
   Subclock mode
   Watch mode
- Bus interface function
   With hold and ready function

# ■ DIFFERENCES AMONG PRODUCTS

#### 1. Memory Size

Before evaluating using the piggyback product, verify its differences from the product that will actually be used. Take particular care on the following points:

• On the MB89P637, the program area starts from address 8007<sub>H</sub> but on the MB89PV630 and MB89637R starts from 8000<sub>H</sub>.

(On the MB89P637, addresses 8000<sup>H</sup> to 8006<sup>H</sup> comprise the option setting area, option settings can be read by reading these addresses. On the MB89PV630/MB89637R, addresses 8000<sup>H</sup> to 8006<sup>H</sup> could also be used as a program ROM. However, do not use these addresses in order to maintain compatibility of the MB89P637.)

- The stack area, etc., is set at the upper limit of the RAM.
- The external area is used.

### 2. Current Consumption

- In the case of the MB89PV630, add the current consumed by the EPROM which connected to the top socket.

### 3. Mask Options

Functions that can be selected as options and how to designate these options vary by the product.

Before using options check section "■ Mask Options".

Take particular care on the following points:

- A pull-up resistor cannot be set for P50 to P53 on the MB89P637.
- Options are fixed on the MB89PV630.

#### 4. Differences between the MB89630 and MB89630R Series

· Memory access area

There are no difference between the access area of MB89635/MB89635R, and that of MB89637/MB89637R. The access area of MB89636 is different from that of the MB89636R when using in external bus mode.

Address	Memory area				
Address	MB89636	MB89636R			
0000н to 007Fн	I/O area	I/O area			
0080н to 037Fн	RAM area	RAM area			
0380н to 047Fн		Access prohibited			
0480н to 7FFFн	External area	External area			
8000н to 9FFFн		Access prohibited			
A000н to FFFFн	ROM area	ROM area			

- Other specifications Both MB89630 series and MB89635R/636R/637R is the same.
- Electrical specifications/electrical characteristics Electrical specifications of the MB89635R/636R/637R series are the same as that of the MB89630 series. Electrical characteristics of both the series are much the same.

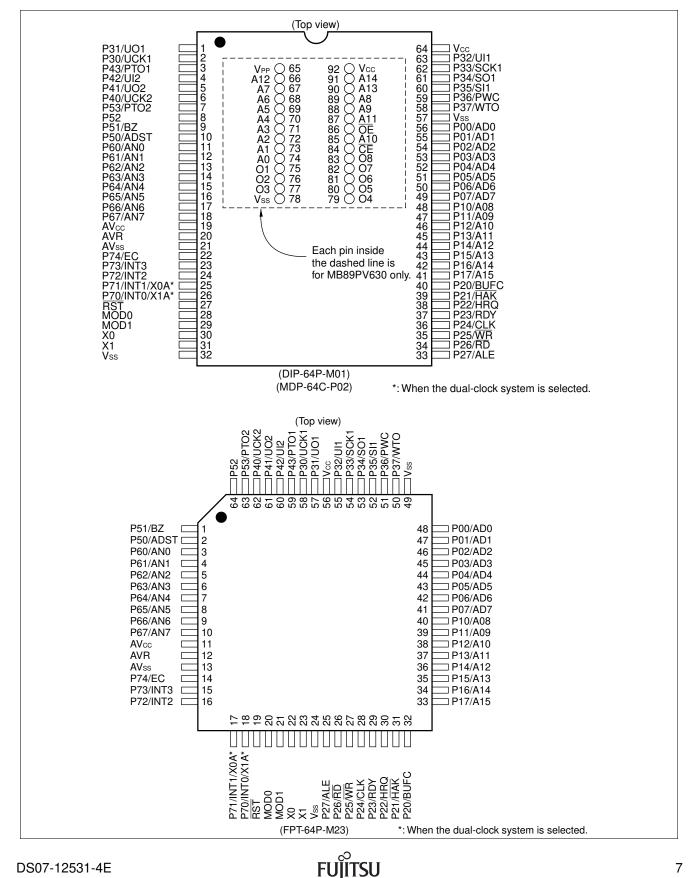

# ■ CORRESPONDENCE BETWEEN THE MB89630 AND MB89630R SERIES

- The MB89630R series is the reduction version of the MB89630 series.
- The the MB89630 and MB89630R series consist of the following products:

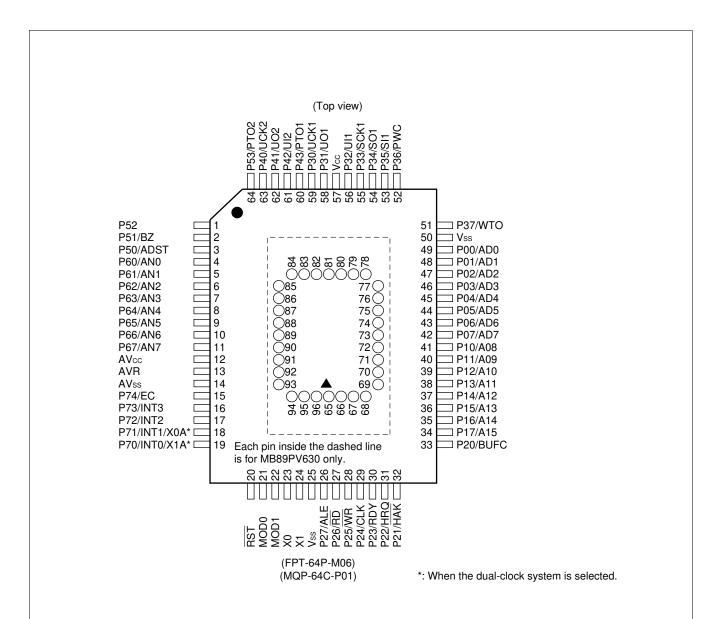

MB89630 series	MB89635	MB89636	MB89637	MB89P637	MB89PV630
MB89630R series	MB89635R	MB89636R	MB89637R		

# MB89630R Series

#### PIN ASSIGNMENT

# ■ PIN DESCRIPTION

Pin no.		Din nome Circuit			
SH-DIP <sup>*1</sup> MDIP <sup>*2</sup>	QFP2 <sup>*3</sup>	QFP1 <sup>*4</sup> MQFP <sup>*5</sup>	Pin name	type	Function
30	22	23	X0	Α	Main clock crystal oscillator pins
31	23	24	X1		
28	20	21	MOD0	D	Operating mode selection pins
29	21	22	MOD1		Connect directly to Vcc or Vss.
27	19	20	RST	C	Reset I/O pin This pin is an N-ch open-drain output type with a pull-up resistor, and a hysteresis input type. "L" is output from this pin by an internal reset source. The internal circuit is initialized by the input of "L".
56 to 49	48 to 41	49 to 42	P00/AD0 to P07/AD7	F	General-purpose I/O ports When an external bus is used, these ports function as the multiplex pins of the lower address output and the data I/O.
48 to 41	40 to 33	41 to 34	P10/A08 to P17/A157	F	General-purpose I/O ports When an external bus is used, these ports function as an upper address output.
40	32	33	P20/BUFC	Н	General-purpose output port When an external bus is used, this port can also be used as a buffer control output by setting the BCTR.
39	31	32	P21/HAK	Н	General-purpose output port When an external bus is used, this port can also be used as a hold acknowledge by setting the BCTR.
38	30	31	P22/HRQ	F	General-purpose output port When an external bus is used, this port can also be used as a hold request input by setting the BCTR.
37	29	30	P23/RDY	F	General-purpose output port When an external bus is used, this port functions as a ready input.
36	28	29	P24/CLK	Н	General-purpose output port When an external bus is used, this port functions as a clock output.
35	27	28	P25/WR	Н	General-purpose output port When an external bus is used, this port functions as a write signal output.
34	26	27	P26/RD	Н	General-purpose output port When an external bus is used, this port functions as a read signal output.

# **MB89630R Series**

# ■ HANDLING DEVICES

### 1. Preventing Latchup

Latchup may occur on CMOS ICs if voltage higher than Vcc or lower than Vss is applied to input and output pins other than medium- and high-voltage pins or if higher than the voltage which shows on "1. Absolute Maximum Ratings" in section "■ Electrical Characteristics" is applied between Vcc and Vss.

When latchup occurs, power supply current increases rapidly and might thermally damage elements. When using, take great care not to exceed the absolute maximum ratings.

Also, take care to prevent the analog power supply (AVcc and AVR) and analog input from exceeding the digital power supply (Vcc) when the analog system power supply is turned on and off.

#### 2. Treatment of Unused Input Pins

Leaving unused input pins open could cause malfunctions. They should be connected to a pull-up or pull-down resistor.

### 3. Treatment of Power Supply Pins on Microcontrollers with A/D and D/A Converters

Connect to be AVcc = DAVC = Vcc and AVss = AVR = Vss even if the A/D and D/A converters are not in use.

#### 4. Treatment of N.C. Pins

Be sure to leave (internally connected) N.C. pins open.

#### 5. Power Supply Voltage Fluctuations

Although V<sub>CC</sub> power supply voltage is assured to operate within the rated range, a rapid fluctuation of the voltage could cause malfunctions, even if it occurs within the rated range. Stabilizing voltage supplied to the IC is therefore important. As stabilization guidelines, it is recommended to control power so that V<sub>CC</sub> ripple fluctuations (P-P value) will be less than 10% of the standard V<sub>CC</sub> value at the commercial frequency (50 Hz to 60 Hz) and the transient fluctuation rate will be less than 0.1 V/ms at the time of a momentary fluctuation such as when power is switched.

## 6. Precautions when Using an External Clock

When an external clock is used, oscillation stabilization time is required even for power-on reset (option selection) and wake-up from stop mode.

# ■ PROGRAMMING TO THE EPROM ON THE MB89P637

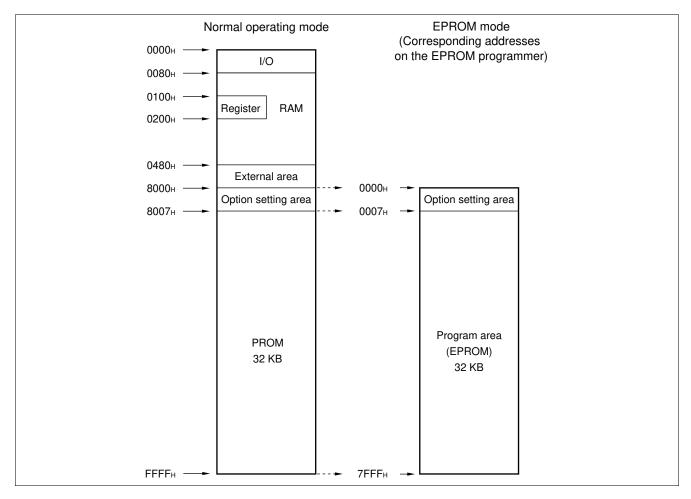

The MB89P637 is an OTPROM version of the MB89630 series.

### 1. Features

- · 32-Kbytes PROM on chip
- Options can be set using the EPROM programmer.
- Equivalency to the MBM27C256A in EPROM mode (when programmed with the EPROM programmer)

## 2. Memory Space

Memory space in each mode is illustrated below.

## 3. Programming to the EPPROM

In EPROM mode, the MB89P637 functions equivalent to the MBM27C256A. This allows the PROM to be programmed with a general-purpose EPROM programmer by using the dedicated socket adapter.

However, the electronic signature mode cannot be used.

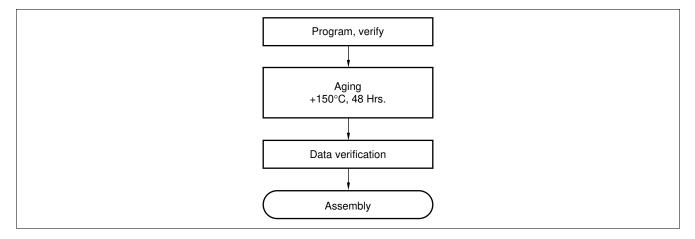

When the operating ROM area for a single chip is 32 Kbytes (8007<sub>H</sub> to FFFF<sub>H</sub>) the EPROM can be programmed as follows:

#### • Programming procedure

- (1) Set the EPROM programmer to the MBM27C256A.
- (2) Load program data into the EPROM programmer at 0007<sup>H</sup> to 7FFF<sup>H</sup>. (Note that addresses 8000<sup>H</sup> to FFFF<sup>H</sup> in the operating mode assign to 0000<sup>H</sup> to 7FFF<sup>H</sup> in EPROM mode).
- (3) Load option data into addresses 0000<sup>H</sup> to 0006<sup>H</sup> of the EPROM programmer.
   (For information about each corresponding option, see "8. OTPROM Option Bit Map".)
- (4) Program with the EPROM programmer.

#### 4. Recommended Screening Conditions

High-temperature aging is recommended as the pre-assembly screening procedure for a product with a blanked OTPROM microcomputer program.

### 5. Programming Yield

All bits cannot be programmed at Fujitsu shipping test to a blanked OTPROM microcomputer, due to its nature. For this reason, a programming yield of 100% cannot be assured at all times.

# ■ PROGRAMMING TO THE EPROM WITH PIGGYBACK/EVALUATION DEVICE

# 1. EPROM for Use

MBM27C256A-20CZ, MBM27C256A-20TV

## 2. Memory Space

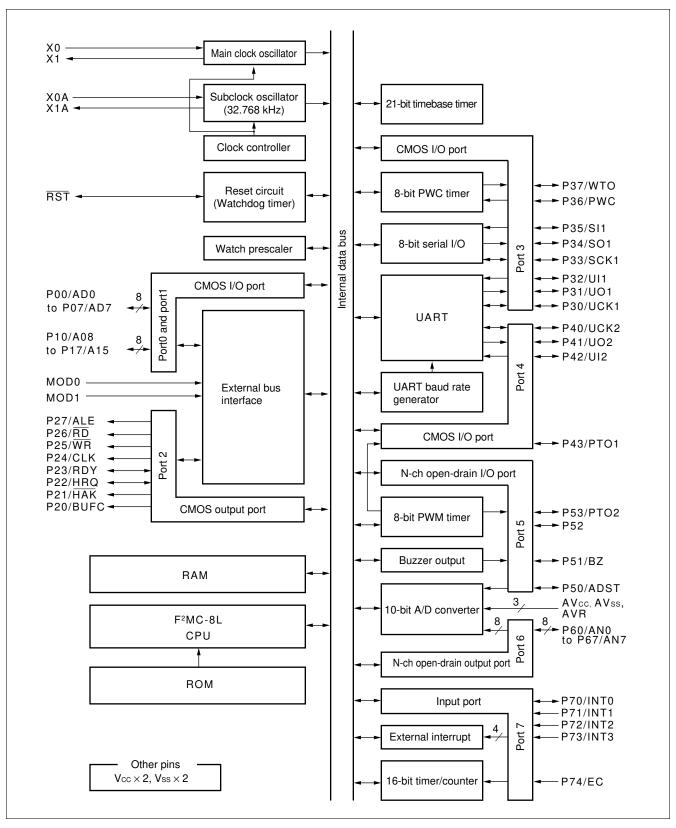

Memory space in each mode, such as 32-Kbyte PROM, option area is diagrammed below.

## 3. Programming to the EPROM

- (1) Set the EPROM programmer to the MBM27C256A.
- (2) Load program data into the EPROM programmer at 0007H to 7FFFH.
- (3) Program to 0000H to 7FFFH with the EPROM programmer.

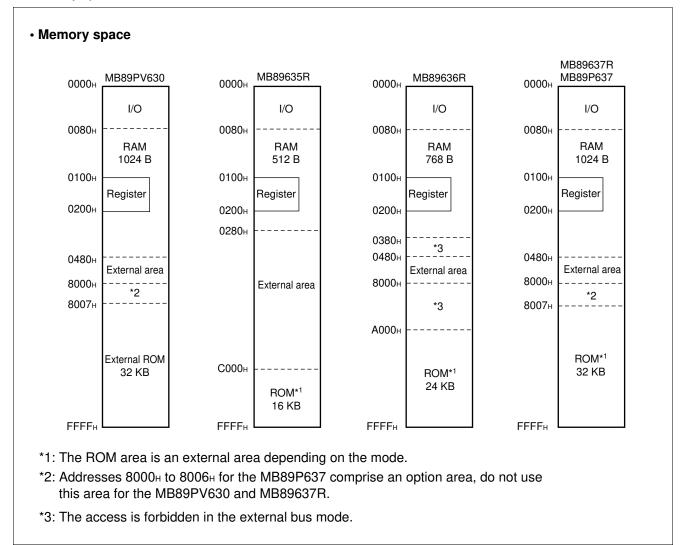

# BLOCK DIAGRAM

# CPU CORE

## 1. Memory Space

The microcontrollers of the MB89630R series offer 64 Kbytes of memory for storing all of I/O, data, and program areas. The I/O area is located at the lowest address. The data area is provided immediately above the I/O area. The data area can be divided into register, stack, and direct areas according to the application. The program area is located at exactly the opposite end of I/O area, that is, near the highest address. Provide the tables of interrupt reset vectors and vector call instructions toward the highest address within the program area. The memory space of the MB89630R series is structured as illustrated below.

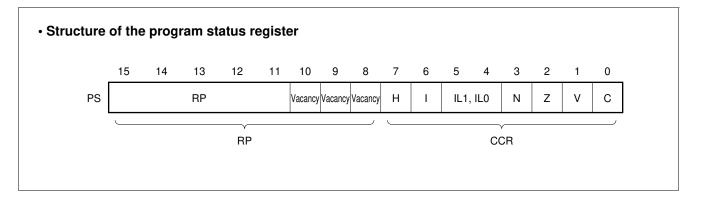

# 2. Registers

The F<sup>2</sup>MC-8L family has two types of registers; dedicated registers in the CPU and general-purpose registers in the memory. The following dedicated registers are provided:

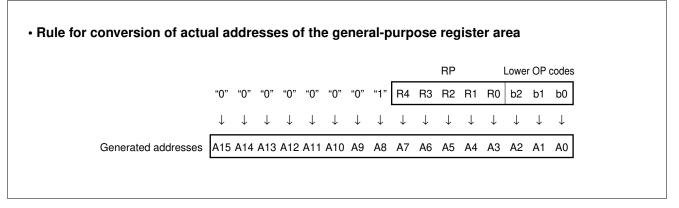

Program counter (PC):	A 16-bit register for indicating the instruction storage positions	
Accumulator (A):	A 16-bit temporary register for storing arithmetic operations, etc. When the instruction is an 8-bit data processing instruction, the lower byte is used.	
Temporary accumulator (T):	A16-bit register which performs arithmetic operations with the accumulator When the instruction is an 8-bit data processing instruction, the lower byte is used.	
Index register (IX):	A16-bit register for index modification	
Extra pointer (EP):	A16-bit pointer for indicating a memory address	
Stack pointer (SP):	A16-bit register for indicating a stack area	
Program status (PS):	A16-bit register for storing a register pointer, a condition code	

◄ 16 bits →	Initial value
PC	: Program counter FFFDH
A	: Accumulator Indeterminate
Т	: Temporary accumulator Indeterminate
IX	: Index register Indeterminate
EP	: Extra pointer Indeterminate
SP	: Stack pointer Indeterminate
PS	: Program status I-flag = 0, IL1, IL0 = 11 The other bit values are indeterminate

The PS can further be divided into higher 8 bits for use as a register bank pointer (RP) and the lower 8 bits for use as a condition code register (CCR). (See the diagram below.)

The RP indicates the address of the register bank currently in use. The relationship between the pointer contents and the actual address is based on the conversion rule illustrated below.

The CCR consists of bits indicating the results of arithmetic operations and the contents of transfer data and bits for control of CPU operations at the time of an interrupt.

- H-flag: Set to '1' when a carry or a borrow from bit 3 to bit 4 occurs as a result of an arithmetic operation. Cleared to '0' otherwise. This flag is for decimal adjustment instructions.
- I-flag: Interrupt is enabled when this flag is set to '1'. Interrupt is disabled when the flag is cleared to '0'. Cleared to '0' at the reset.
- IL1, IL0: Indicates the level of the interrupt currently allowed. Processes an interrupt only if its request level is higher than the value indicated by this bit.

IL1	IL0	Interrupt level	High-low
0	0	1	High
0	1		t
1	0	2	
1	1	3	Low

- N-flag: Set to '1' if the MSB becomes to '1' as the result of an arithmetic operation. Cleared to '0' when the bit is cleared to '0'.
- Z-flag: Set to '1' when an arithmetic operation results in 0. Cleared to '0' otherwise.
- V-flag: Set to '1' if the complement on 2 overflows as a result of an arithmetic operation. Cleared to '0' if the overflow does not occur.
- C-flag: Set to '1' when a carry or a borrow from bit 7 occurs as a result of an arithmetic operation. Cleared to '0' otherwise.

Set to the shift-out value in the case of a shift instruction.

The following general-purpose registers are provided:

General-purpose registers: An 8-bit register for storing data

The general-purpose registers are 8 bits and located in the register banks of the memory. One bank contains eight registers and up to a total of 32 banks can be used on the MB89630R series. The bank currently in use is indicated by the register bank pointer (RP).
