MC10H351

Quad TTL/NMOS to PECL* Translator

Description

The MC10H351 is a quad translator for interfacing data between a saturated logic section and the PECL section of digital systems when only a +5.0 Vdc power supply is available. The MC10H351 has TTL/NMOS compatible inputs and PECL complementary open-emitter outputs that allow use as an inverting/non-inverting translator or as a differential line driver. When the common strobe input is at a low logic level, it forces all true outputs to the PECL low logic state ($\approx +3.2$ V) and all inverting outputs to the PECL high logic state ($\approx +4.1$ V).

The MC10H351 can also be used with the MC10H350 to transmit and receive TTL/NMOS information differentially via balanced twisted pair lines.

Features

- Single +5.0 Power Supply
- All V_{CC} Pins Isolated On Chip
- Differentially Drive Balanced Lines
- $t_{pd} = 1.3$ nsec Typical
- These Devices are Pb-Free, Halogen Free and are RoHS Compliant

†Each MECL 10H™ series circuit has been designed to meet the dc specifications shown in the test table, after thermal equilibrium has been established. The circuit is in a test socket or mounted on a printed circuit board and transverse air flow greater than 500 lfpm is maintained. Outputs are terminated through a 50 Ω resistor to $V_{CC} - 2.0 \text{ Vdc}$.
